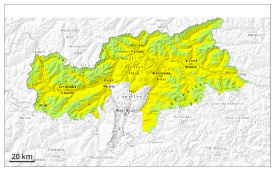
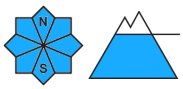
Danger Level 2 - Moderate



Tendency: Constant avalanche danger
on Thursday 30 04 2026

Wet snow



Wet snow requires caution.

Wet avalanches can in isolated cases be released by a single winter sport participant. This applies especially below approximately 2600 m.

As a consequence of new snow and a moderate wind, clearly visible wind slabs will form in particular in high Alpine regions. These are small and can only be released in isolated cases.

Weak layers in the old snowpack can be released in isolated cases and mostly by large additional loads in particular on very steep shady slopes, in particular above approximately 2500 m.

Snowpack

Danger patterns dp.3: rain | dp.1: deep persistent weak layer

Outgoing longwave radiation during the night will be severely restricted at times. Some rain will fall until late morning in some regions.

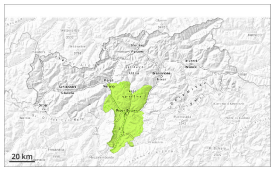
Shady slopes above approximately 2500 m: Faceted weak layers exist in the bottom section of the old snowpack at elevated altitudes.

On steep sunny slopes as well as below approximately 1800 m hardly any snow is lying.

Tendency

A clear night will be followed in the early morning by favourable conditions generally. Gradual increase in danger of wet avalanches as a consequence of warming during the day and solar radiation.

Danger Level 1 - Low



1

Tendency: Constant avalanche danger
on Thursday 30 04 2026

Wet snow requires caution.

Only isolated wet avalanches are possible. Caution is to be exercised on extremely steep shady slopes. Mostly avalanches are rather small.

Snowpack

Danger patterns dp.3: rain dp.10: springtime scenario

Outgoing longwave radiation during the night will be severely restricted. The surface of the snowpack will freeze very little and will soften quickly. Some rain will fall in the afternoon.
Only a little snow is now lying.

Tendency

Low avalanche danger will prevail. Wet snow requires caution.
