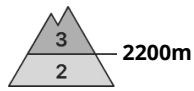
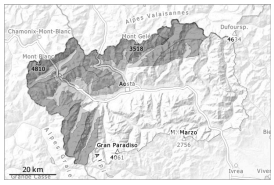
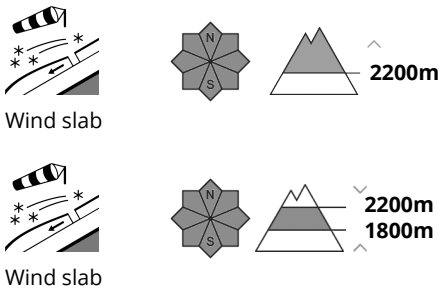
Danger Level 3 - Considerable



Tendency: Constant avalanche danger
on Monday 30 03 2026





Wind slabs represent the main danger.

As a consequence of new snow and a strong to storm force wind from northerly directions, extensive wind slabs formed also in areas not adjacent to ridgelines. Along the border with France and along the border with Switzerland these avalanche prone locations are more prevalent. They will be covered with new snow in some cases and therefore difficult to recognise.
In some localities 2 to 5 cm of snow, and even more in some localities, will fall until Sunday above approximately 1800 m. In some places the wind slabs will increase in size moderately as the day progresses. They can be released, caution is to be exercised at transitions from a shallow to a deep snowpack, when entering gullies and bowls for example. Whumpfing sounds and the formation of shooting cracks when stepping on the snowpack can indicate the danger.
Dry avalanches can reach medium size.
Backcountry touring calls for caution and restraint.

Snowpack

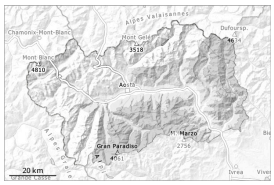
Danger patterns dp.6: cold, loose snow and wind

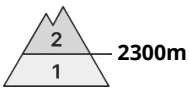
20 to 30 cm of snow, but less in some localities, fell on Thursday above approximately 2000 m. The wind was strong to storm force over a wide area. The wind has transported the fresh and old snow significantly. Over a wide area snow depths vary greatly, depending on the infuence of the wind.
Towards its surface, the snowpack is hard and its surface has a crust that is strong in many cases, in particular adjacent to ridgelines and in pass areas.
Towards its surface, the snowpack is soft and has a loosely bonded surface, especially in places that are protected from the wind.
Weak layers exist in the snowpack in particular on steep shady slopes.

Tendency

In some localities 5 to 15 cm of snow will fall on Monday above approximately 1600 m. The wind will be strong. Fresh wind slabs require caution. These conditions will cause a slight rise in the danger.

Danger Level 2 - Moderate





Tendency: Constant avalanche danger
on Monday 30 03 2026

Wind slab

2300m

Wind slabs represent the main danger.

The northwesterly wind has transported the fresh and old snow significantly. Wind slabs can in some places be released by a single winter sport participant and reach medium size. In some localities 2 to 5 cm of snow, but less in some localities, will fall until Sunday above approximately 1800 m. The wind slabs will be covered with new snow in some cases and therefore difficult to recognise, caution is to be exercised at transitions from a shallow to a deep snowpack, when entering gullies and bowls for example. Backcountry touring calls for caution.

Snowpack

Danger patterns dp.6: cold, loose snow and wind

In some localities 2 to 5 cm of snow, but less in some localities, will fall until Sunday above approximately 1800 m.
5 to 10 cm of snow, but less in some localities, fell on Thursday above approximately 2000 m.
The wind was strong to storm force over a wide area. The wind has transported the fresh and old snow significantly. Over a wide area snow depths vary greatly, depending on the infuence of the wind.
Towards its surface, the snowpack is hard and its surface has a crust that is strong in many cases, in particular adjacent to ridgelines and in pass areas.
Towards its surface, the snowpack is soft and has a loosely bonded surface, especially in places that are protected from the wind.
Weak layers exist in the snowpack in particular on steep shady slopes.

Tendency

In some localities 2 to 5 cm of snow will fall on Monday above approximately 1600 m. The wind will be strong. Wind slabs. These conditions will cause a slight rise in the danger of dry avalanches.
