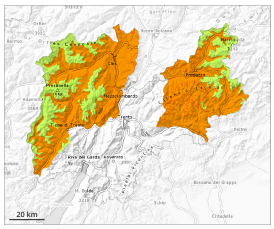
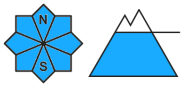
Danger Level 3 - Considerable



Tendency: Constant avalanche danger
on Tuesday 15 04 2025

Wet snow



Snowpack stability: very poor
Frequency: some
Avalanche size: medium

Wet snow represents the main danger. As the penetration by moisture increases wet avalanches are possible at any time.

The danger of wet avalanches will persist. In particular on very steep west, north and east facing slopes more frequent natural wet avalanches are possible as the penetration by moisture increases. Avalanches can release the saturated snowpack and reach medium size.

The conditions are unfavourable for backcountry touring, in particular at intermediate and high altitudes.

Snowpack

Danger patterns dp.10: springtime scenario | dp.3: rain

Outgoing longwave radiation during the night will be severely restricted. The surface of the snowpack will only just freeze and will already be soft in the early morning. The high temperatures will give rise to increasing and thorough wetting of the snowpack below approximately 2600 m. These weather conditions will give rise to a loss of strength within the snowpack.

Tendency

Wet snow represents the main danger.

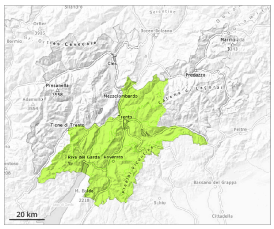
Danger Level 1 - Low



Tendency: Constant avalanche danger
on Tuesday 15 04 2025

Wet snow

Snowpack stability: fair
Frequency: few
Avalanche size: medium

Low avalanche danger will prevail. The danger of moist and wet avalanches will increase during the day.

As a consequence of warming during the day individual moist snow slides and avalanches are possible, but they will be mostly small. The avalanche prone locations are to be found in particular in steep terrain. As a consequence of mild temperatures and very cloudy skies a sometimes precarious avalanche situation developed at the weekend.

Snowpack

Danger patterns dp.10: springtime scenario

The snowpack will be subject to considerable local variations.

Tendency

The avalanche danger will persist.
