SNOW QUALITY

On Friday it will be mostly sunny. As a consequence of warming during the day and solar radiation moist small and medium sized avalanches are possible. In addition as the day progresses some gliding avalanches are possible. Avalanche prone weak layers exist in the top section of the snowpack in particular on steep northwest, north and east facing slopes. These can be released easily and reach medium size. The avalanche prone locations are to be found in areas close to the tree line and at transitions from a shallow to a deep snowpack. Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls.

STABILITY OF THE SNOW MANTLE

Low and intermediate altitudes :. The surface of the snowpack will freeze to form a strong crust and will already soften in the late morning. Adjacent to ridgelines snow depths vary greatly, depending on the infuence of the wind. Weak layers in the upper part of the snowpack necessitate caution and restraint. Maintaining distances between individuals is recommended.
