SNOW QUALITY

The near-surface layers of the snowpack can be released by large additional loads also on very steep shady slopes. From midday as a consequence of warming during the day there will be an increase in the danger of gliding avalanches. Areas with glide cracks are to be avoided. Medium-sized avalanches are to be expected. Maintaining distances between individuals is recommended.

STABILITY OF THE SNOW MANTLE

In the vicinity of peaks at high altitude snow depths vary greatly, depending on the infuence of the wind. The surface of the snowpack will only just freeze and will soften during the day. The solar radiation will give rise to gradual moistening of the snowpack sunny slopes. This applies in particular at low altitude.
