Updated 23 04 2025, 06:27

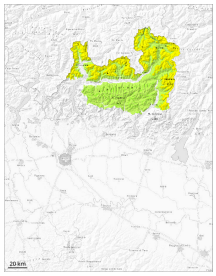
Danger Level 2 - Moderate



Tendency: Constant avalanche danger
on Thursday 24 04 2025

Wind slab

Snowpack stability: fair
Frequency: some
Avalanche size: large

New snow

Snowpack stability: fair
Frequency: few
Avalanche size: large

Wet snow

Snowpack stability: fair
Frequency: few
Avalanche size: medium

New snow and wet snow represent the main danger. Medium-sized dry and wet avalanches are to be expected above approximately 2000 m.

As a consequence of new snow and wind, sometimes deep wind slabs formed in the last few days adjacent to ridgelines and in gullies and bowls as well as above approximately 2600 m. They can be released by a single winter sport participant in some cases especially on very steep shady slopes. Especially on very steep west, north and east facing slopes and below approximately 2600 m individual wet slab avalanches are to be expected as the penetration by moisture increases. Wet avalanches can as before be released by a single winter sport participant. Dry and moist avalanches are possible, in particular medium-sized ones. As the day progresses as a consequence of warming during the day there will be a rapid increase in the danger of wet avalanches. Individual gliding avalanches can also occur, caution is to be exercised in particular on very steep grassy slopes in the regions with a lot of snow.

Snowpack

Danger patterns dp.6: cold, loose snow and wind | dp.10: springtime scenario

The snowpack remains prone to triggering in particular on steep slopes. Especially high Alpine regions: As a consequence of the southeasterly wind the wind slabs will increase in size additionally.

The sleet gave rise to significant moistening of the snowpack below approximately 2600 m. New snow and wind slabs are lying on a moist old snowpack.

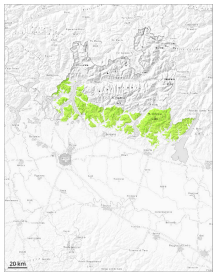
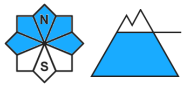
Danger Level 1 - Low



Tendency: Constant avalanche danger
on Thursday 24 04 2025

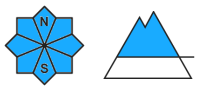
Wet snow



Treeline

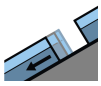
Snowpack stability: fair
Frequency: few
Avalanche size: small

Wind slab

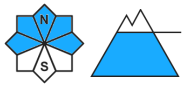


2300m

Snowpack stability: fair
Frequency: few
Avalanche size: medium



Gliding snow



Treeline

Snowpack stability: fair
Frequency: few
Avalanche size: small

In the course of the day the natural activity of small moist and wet avalanches will increase.

The surface of the snowpack cooled hardly at all during the overcast night and will soften quickly. The fresh snow and the mostly small wind slabs can be released by a single winter sport participant in isolated cases in particular on steep, little used north facing slopes above approximately 2200 m.
