Danger Level 4 - High

Tendency: Decreasing avalanche danger
on Friday 20 02 2026

As a consequence of new snow and stormy weather a dangerous avalanche situation will persist in some regions.

As a consequence of snowfall and the occasionally storm force northwesterly wind, fresh snow drift accumulations formed during the last three days. This applies in particular in the regions exposed to the foehn wind and in areas close to the tree line, and in gullies and bowls, and behind abrupt changes in the terrain.
The avalanche-prone wind slabs can be released easily, even by a single winter sport participant,.

On wind-loaded slopes and in starting zones where no previous releases have taken place individual large and, in isolated cases, very large powder avalanches are possible as a consequence of warming.

Snowpack

Danger patterns dp.6: cold, loose snow and wind

In some regions over a wide area 50 to 90 cm of snow, and even more in some localities, has fallen since Monday.
The sometimes storm force wind has transported a lot of snow.
In particular in the vicinity of peaks snow depths vary greatly, depending on the infuence of the wind.

Avalanche prone weak layers exist in the old snowpack in particular on steep northwest, north and east facing slopes. In particular at a distance from ridgelines as well as in places that are protected from the wind: In some places various wind slab layers are lying on surface hoar.

Danger Level 3 - Considerable

Tendency: Decreasing avalanche danger

Wind slab

As a consequence of new snow and stormy weather a dangerous avalanche situation will persist in some regions.

As a consequence of snowfall and the occasionally storm force northwesterly wind, fresh snow drift accumulations formed during the last three days. This applies in particular in the regions exposed to the foehn wind and in areas close to the tree line, and in gullies and bowls, and behind abrupt changes in the terrain.
The avalanche-prone wind slabs can be released easily, even by a single winter sport participant,.

On wind-loaded slopes and in starting zones where no previous releases have taken place medium-sized and large dry and moist avalanches are possible as a consequence of warming.

Snowpack

Danger patterns dp.6: cold, loose snow and wind

In some regions over a wide area 40 to 80 cm of snow, and even more in some localities, has fallen since Monday.
The sometimes storm force wind has transported a lot of snow.
In particular in the vicinity of peaks snow depths vary greatly, depending on the infuence of the wind.

Avalanche prone weak layers exist in the old snowpack in particular on steep northwest, north and east facing slopes.

Danger Level 3 - Considerable

Down to low altitudes snow will fall over a wide area. The wind will be strong. Wind slabs represent the main danger.

The sometimes strong wind will transport the fresh and old snow significantly. As a consequence of the strong northwesterly wind, fresh snow drift accumulations will form by the early morning. These will form in particular above approximately 2000 m.

In particular intermediate and high altitudes as well as in places that are protected from the wind: Soft wind slabs can be released by a single winter sport participant in areas close to the tree line.

In addition the hard wind slabs of the last few days in pass areas in all aspects and generally at elevated altitudes are capable of being triggered now as before. This applies in particular in case of a large load. The older wind slabs will be covered with new snow and therefore difficult to recognise.

Several medium-sized and, in isolated cases, large dry and moist avalanches are possible as a consequence of warming.

Snowpack

Danger patterns dp.6: cold, loose snow and wind

In some localities 5 to 20 cm of snow, and even more in some localities, will fall on Thursday above approximately 1500 m. The strong wind will transport the fresh and old snow significantly.
In particular in the vicinity of peaks snow depths vary greatly, depending on the infuence of the wind.

Western Prealps and along the border with France: Isolated avalanche prone weak layers exist in the old snowpack in particular on steep northwest, north and east facing slopes. In some places new snow and wind slabs are lying on surface hoar.
