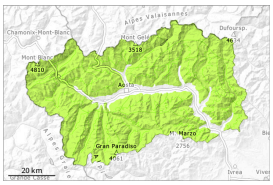
Danger Level 2 - Moderate

AM:



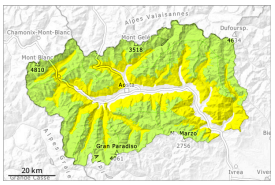
Tendency: Constant avalanche danger
on Tuesday 08 04 2025

Wind slab

Snowpack stability: fair
Frequency: few
Avalanche size: medium

PM:

Tendency: Constant avalanche danger
on Tuesday 08 04 2025



Wet snow

Snowpack stability: poor
Frequency: few
Avalanche size: medium

Wind slab

Snowpack stability: fair
Frequency: few
Avalanche size: medium

The backcountry touring conditions in the morning, after a clear night, are quite favourable. Gradual increase in danger as a consequence of warming during the day and solar radiation.

The surface of the snowpack will freeze to form a strong crust and will soften later than the day before. As a consequence of warming during the day and solar radiation small and medium-sized moist and wet avalanches are possible. This applies on steep sunny slopes below approximately 2600 m, and on steep shady slopes below approximately 2400 m.
Backcountry tours and ascents to alpine cabins should be concluded timely.
The fresh wind slabs can be released by a single winter sport participant in isolated cases. In high Alpine regions these avalanche prone locations are more prevalent. Especially on the northern ridge, where strong winds are locally expected.
Avalanches can penetrate deep layers. This applies in particular on very steep northwest, north and northeast facing slopes above approximately 2400 m. These avalanche prone locations are very rare but are barely recognisable, even to the trained eye.

Snowpack

Danger patterns dp.10: springtime scenario

The weather will be sunny.
As a consequence of highly fluctuating temperatures a crust formed on the surface during the last six days, this also applies on shady slopes below approximately 2500 m.
The spring-like weather conditions gave rise to increasing moistening of the snowpack on sunny slopes

below approximately 2900 m. Towards its base, the snowpack is wet, also on shady slopes below approximately 2400 m.

Tendency

The avalanche danger will persist.
