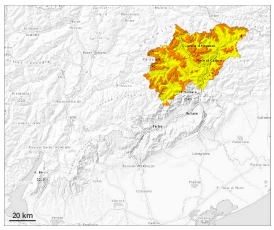
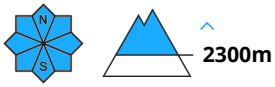
Danger Level 3 - Considerable



Tendency: Constant avalanche danger
on Thursday 08 05 2025

New snow



Snowpack stability: very poor
Frequency: some
Avalanche size: medium

Wet snow

Snowpack stability: very poor
Frequency: few
Avalanche size: medium

Moist and wet avalanches are the main danger.

Above approximately 1900 m snow will fall in some localities. This snow can be released easily or naturally in all aspects at high altitude. In particular in the regions exposed to heavier precipitation numerous medium-sized and, in isolated cases, large avalanches are to be expected as the snowfall becomes more intense. The avalanche prone locations are to be found in particular at the base of rock walls above approximately 2300 m. In the typical avalanche paths in the regions exposed to heavier precipitation the wet avalanches can in isolated cases reach large size.

Snowpack

As a consequence of mild temperatures and high relative humidity no crust developed on the surface during the last four days. Above approximately 1900 m snow has fallen since yesterday in some localities. Over a wide area new snow is lying on a weakly bonded old snowpack. Avalanches can be released in deeper layers very easily.

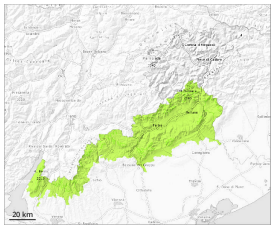
Danger Level 1 - Low



Tendency: Constant avalanche danger
on Thursday 08 05 2025

Wet snow

Snowpack stability: very poor
Frequency: few
Avalanche size: small

Moist and wet avalanches are the main danger.

The danger of wet and gliding avalanches will increase but remain within the current danger level.

Snowpack

The rain will give rise to extreme and thorough wetting of the snowpack in all aspects below approximately 2300 m. These conditions will cause a very rapid weakening of the snowpack.
