SNOW QUALITY

The near-surface layers of the snowpack can be released by large additional loads also on very steep shady slopes. From midday as a consequence of warming during the day there will be an increase in the danger of gliding avalanches. Areas with glide cracks are to be avoided. Small and, in isolated cases, medium-sized avalanches are possible. Maintaining distances between individuals is recommended. The avalanche prone locations are barely recognisable because of the poor visibility.

STABILITY OF THE SNOW MANTLE

In the vicinity of peaks at high altitude snow depths vary greatly, depending on the infuence of the wind. The surface of the snowpack will freeze to form a strong crust and will soften during the day. The weather conditions to gradual moistening of the snowpack sunny slopes. This applies in particular at low altitude. On Monday it will be very cloudy. Some snow will fall during the night in particular in the north.
