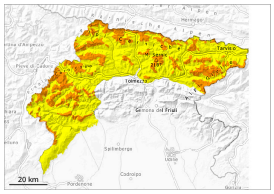
Danger Level 3 - Considerable



1700m

Tendency: Constant avalanche danger
on Tuesday 11 03 2025

New snow

1700m

Snowpack stability: poor
Frequency: some
Avalanche size: large

Wind slab

1700m

Snowpack stability: poor
Frequency: some
Avalanche size: large

Wet snow

1900m

Snowpack stability: fair
Frequency: some
Avalanche size: medium

Over a wide area wind and new snow.
As a consequence of the precipitation the avalanche prone locations will become more prevalent as the day progresses.

The avalanche prone locations are to be found in particular at the base of rock walls and behind abrupt changes in the terrain and adjacent to ridgelines and in gullies and bowls. In particular in the regions exposed to heavier precipitation avalanches can be released in deep layers of the snowpack.
The wind slabs must be evaluated with care and prudence.
Avalanches can be released by small loads.

Snowpack

As a consequence of new snow and wind, easily released wind slabs will form in all aspects. The wind slabs have bonded poorly with the old snowpack.
Weak layers exist in the snowpack. The rain will give rise to increasing and thorough wetting of the old snowpack below approximately 1700 m.

Tendency

Over a wide area light precipitation.
