Updated 02 01 2026, 18:37

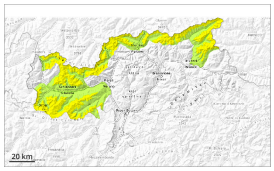
Danger Level 2 - Moderate



2600m

Tendency: Decreasing avalanche danger
on Sunday 04 01 2026

Wind slab

2600m

Wind slabs require caution.

The fresh and older wind slabs can be released in some cases in particular on northwest to north to east facing aspects above approximately 2600 m. Caution is to be exercised adjacent to ridgelines and in gullies and bowls. In very isolated cases avalanches are medium-sized. Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls.

Sunny slopes: In steep terrain there is a danger of falling on the hard snow surface.

Snowpack

Danger patterns dp.6: cold, loose snow and wind

Some snow will fall in particular in the north. As a consequence of a sometimes storm force wind from westerly directions, further wind slabs will form. The hard wind slabs are lying on soft layers in particular on shady slopes at elevated altitudes.

Shady slopes: The snowpack consists of faceted crystals.

The snowpack will be generally subject to considerable local variations. A little snow is lying in all altitude zones. Steep south facing slopes: The snowpack is well consolidated and its surface has a melt-freeze crust that is strong in many cases.

Tendency

Gradual decrease in avalanche danger.

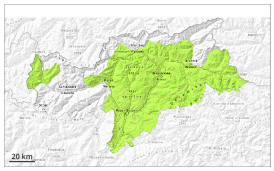
Danger Level 1 - Low



Tendency: Constant avalanche danger
on Sunday 04 01 2026

Wind slab

2200m

Wind slabs require caution. Individual avalanche prone locations are to be found on steep shady slopes at elevated altitudes.

The fresh and older wind slabs can be released in some cases in particular on northwest to north to east facing aspects above approximately 2200 m. Caution is to be exercised adjacent to ridgelines and in gullies and bowls. Mostly avalanches are only small. Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls.

Sunny slopes: In steep terrain there is a danger of falling on the hard snow surface.

Snowpack

As a consequence of a sometimes storm force wind from westerly directions, further wind slabs will form. The hard wind slabs are lying on soft layers in particular on shady slopes at elevated altitudes.

Shady slopes: The snowpack consists of faceted crystals.

The snowpack will be generally subject to considerable local variations. A little snow is lying in all altitude zones. Steep south facing slopes: The snowpack is well consolidated and its surface has a melt-freeze crust that is strong in many cases.

Tendency

Low avalanche danger will prevail.
