Danger Level 3 - Considerable

AM:

Tendency: Constant avalanche danger
on Sunday 01 03 2026

PM:

Tendency: Constant avalanche danger
on Sunday 01 03 2026

The snowpack will be prone to triggering above approximately 1800 m. Wind slabs and weakly bonded old snow represent the main danger. Weak layers in the old snowpack necessitate defensive route selection.
As a consequence of warming during the day, the likelihood of moist avalanches being released will increase on south facing slopes below approximately 2500 m.

Wind slabs require caution. Weak layers in the old snowpack can be released even easily by individual winter sport participants, especially on steep west, north and east facing slopes at high altitudes and in

high Alpine regions. Avalanches can penetrate down to the ground and reach large size. The avalanche prone locations are prevalent barely recognisable for beginners.
Whumpfing sounds and the formation of shooting cracks when stepping on the snowpack serve as an alarm indicating the danger.
As a consequence of warming during the day, the likelihood of moist and wet avalanches being released will increase on south facing slopes below approximately 2500 m.

Snowpack

Danger patterns dp.4: cold following warm / warm following cold dp.1: deep persistent weak layer

Towards its base, the snowpack is faceted and weak. Avalanches can be released in deeper layers also. In addition the fresh wind slabs adjacent to ridgelines and in gullies and bowls are easily triggered.

Tendency

As a consequence of warming during the day the prevalence of the avalanche prone locations will increase as the day progresses.

Danger Level 2 - Moderate

AM:

1500m

Tendency: Constant avalanche danger
on Sunday 01 03 2026

Wind slab

1500m

Wet snow

1000m

PM:

Tendency: Constant avalanche danger
on Sunday 01 03 2026

Wind slab

1500m

Wet snow

1000m

The wind slabs can be released easily in some places in particular on steep shady slopes. Weak layers in the old snowpack necessitate caution and restraint.
As a consequence of warming moist small and medium sized avalanches are to be expected.

Dry avalanches can be released in deeper layers also.
As a consequence of warming during the day, the likelihood of moist and wet avalanches being released will increase on south facing slopes below approximately 2500 m.

Snowpack

Danger patterns dp.6: cold, loose snow and wind | dp.10: springtime scenario

Precarious weak layers exist in the old snowpack in particular on steep northwest, north and northeast facing slopes.

Tendency

As a consequence of warming during the day the prevalence of the avalanche prone locations will increase

> as the day progresses.
