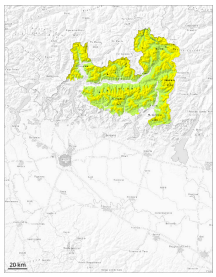
Danger Level 2 - Moderate



Treeline

Tendency: Increasing avalanche danger
on Thursday 25 12 2025

New snow

Treeline

Persistent
weak layer

In the course of the day danger level 2 (moderate) will be reached in the regions exposed to heavier precipitation above approximately 800 m.

In many cases new snow is lying on old snow containing large grains. Precarious weak layers exist in the snowpack on wind-protected shady slopes.
In isolated cases the avalanches are medium-sized and can be released in some cases even by a single winter sport participant.

Snowpack

Danger patterns dp.6: cold, loose snow and wind

The snowpack remains subject to considerable local variations above approximately 2400 m.
The wind slabs are lying on top of a weakly bonded old snowpack on shady slopes at elevated altitudes.
Faceted weak layers exist in the bottom section of the old snowpack in shady places that are protected from the wind.
At low and intermediate altitudes thus far only a little snow is lying.

Tendency

Some snow will fall over a wide area. The fresh snow and the mostly small wind slabs are lying on the unfavourable surface of an old snowpack on north to northeast to northwest facing aspects above approximately 800 m.

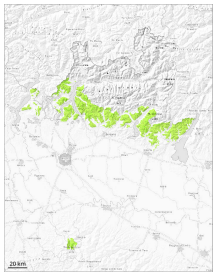
Danger Level 1 - Low



Tendency: Increasing avalanche danger
on Thursday 25 12 2025

Persistent
weak layer

1800m

New snow represents the main danger.

New snow above approximately 800 m. Avalanche prone weak layers exist in the snowpack especially on shady slopes.

Snowpack

Danger patterns dp.1: deep persistent weak layer

From a snow sport perspective, in most cases insufficient snow is lying. Individual avalanche prone locations are to be found in shady places that are protected from the wind.

Tendency

Some snow will fall over a wide area. The fresh snow and the mostly small wind slabs are lying on the unfavourable surface of an old snowpack on north to northeast to northwest facing aspects above approximately 800 m.
