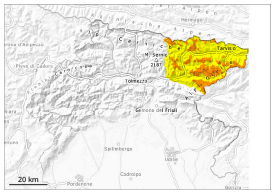
Danger Level 3 - Considerable



Treeline

Tendency: Constant avalanche danger
on Thursday 20 03 2025

New snow

Treeline

Snowpack stability: poor
Frequency: some
Avalanche size: large

Wind slab

Treeline

Snowpack stability: poor
Frequency: some
Avalanche size: large

New snow

Treeline

Snowpack stability: fair
Frequency: some
Avalanche size: medium

On steep slopes, avalanche activity has already peaked. Numerous medium-sized to large avalanches have been released. The weather conditions gave rise to consolidation of the snowpack in some places. Decrease in avalanche danger.

The new snow and wind slabs must be evaluated with care and prudence. In particular in the regions exposed to heavier precipitation more large to very large avalanches are possible. The avalanche prone locations are to be found in particular at the base of rock walls and behind abrupt changes in the terrain and adjacent to ridgelines and in gullies and bowls. Avalanches can be released in deep layers of the snowpack.
Gliding avalanches can also occur. This applies in particular on sunny slopes.
The avalanches can be released by small loads.

Snowpack

As a consequence of new snow and wind, wind slabs formed. Over a wide area new snow is lying on a wet old snowpack.

Tendency

The weather will be clear.
Outgoing longwave radiation during the night will be quite good. As a consequence of falling temperatures a crust will form on the surface during the next few days.
