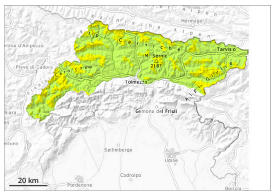
Danger Level 2 - Moderate



Tendency: Increasing avalanche danger
on Wednesday 26 02 2025

Wind slab

Snowpack stability: fair
Frequency: some
Avalanche size: medium

Persistent
weak layer

Snowpack stability: fair
Frequency: some
Avalanche size: medium

At elevated altitudes a moderate avalanche danger will prevail.

The wind slabs remain in some cases prone to triggering. Weak layers in the old snowpack necessitate caution. The avalanche prone locations are to be found in particular at the base of rock walls and behind abrupt changes in the terrain and adjacent to ridgelines and in gullies and bowls. In particular on steep slopes loose snow avalanches are possible. Avalanches can be released, mostly by large loads.

Snowpack

Precarious weak layers exist in the snowpack.

Tendency

Over a wide area wind and new snow. As a consequence of the precipitation the prevalence of the avalanche prone locations will increase.

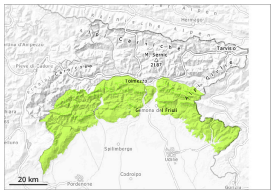
Danger Level 1 - Low



Tendency: Increasing avalanche danger
on Wednesday 26 02 2025

Wind slab

Snowpack stability: fair

Frequency: few

Avalanche size: small

Over a wide area a little snow is lying.

The avalanche prone locations are to be found in particular adjacent to ridgelines and in gullies and bowls and at transitions from a shallow to a deep snowpack. Avalanches can be released by large loads.
In particular on steep slopes loose snow avalanches are possible.

Snowpack

The snowpack will be subject to considerable local variations.
Weak layers exist in the snowpack in particular on shady slopes.

Tendency

Over a wide area wind and new snow. As a consequence of the precipitation the prevalence of the avalanche prone locations will increase.
