SNOW QUALITY

The wind slabs will be covered with new snow and therefore barely recognisable. The near-surface layers of the snowpack can be released in some places by individual winter sport participants. On steep northwest, north and east facing slopes these avalanche prone locations are more prevalent. In the afternoon as the penetration by moisture increases there will be an increase in the danger of moist avalanches. Medium-sized avalanches are to be expected. Individual gliding avalanches can also occur.

STABILITY OF THE SNOW MANTLE

A lot of snow is already lying. In the vicinity of peaks at high altitude snow depths vary greatly, depending on the infuence of the wind. Thursday :. Up to high altitudes rain will fall from midday. The rain will give rise to increasing moistening of the snowpack especially at low and intermediate altitudes. Friday :. The surface of the snowpack will freeze very little and will soften during the day. The solar radiation will give rise to gradual moistening of the snowpack sunny slopes in all altitude zones.
