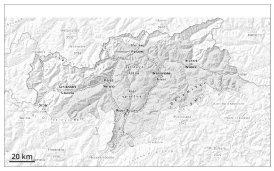
low	moderate	considerable	high	very high

Danger Level 1 - Low



Tendency: Constant avalanche danger
on Tuesday 16 12 2025

Low avalanche danger will prevail.

Avalanches can scarcely be released. Very isolated avalanche prone locations are to be found on very steep shady slopes at elevated altitudes.

Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls.

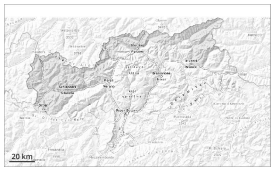
Snowpack

The snowpack will be in most cases stable.
Outgoing longwave radiation during the night will be quite good.
Steep sunny slopes: The solar radiation will give rise as the day progresses to slight moistening of the snowpack.
From a snow sport perspective, in most cases insufficient snow is lying.

Tendency

Low avalanche danger will prevail.

Danger Level 1 - Low



Tendency: Constant avalanche danger
on Tuesday 16 12 2025

Persistent
weak layer

2600m

The avalanche prone locations are rare.

In isolated cases avalanches can be triggered in the weakly bonded old snow. Such avalanche prone locations are to be found in particular on extremely steep shady slopes above approximately 2600 m. Mostly avalanches are small.

As a consequence of the moderate to strong southerly wind, fresh snow drift accumulations will form. This applies especially on shady slopes in high Alpine regions.
Apart from the danger of being buried, restraint should be exercised as well in view of the danger of avalanches sweeping people along and giving rise to falls.

Snowpack

All aspects below approximately 2600 m: The snowpack is largely stable and its surface has a crust.
Shady slopes above approximately 2600 m: Faceted weak layers exist in the bottom section of the snowpack.
Steep sunny slopes: The solar radiation will give rise as the day progresses to slight moistening of the snowpack.

The snowpack will be subject to considerable local variations. From a snow sport perspective, in most cases insufficient snow is lying.

Tendency

Low avalanche danger will prevail.
