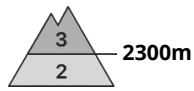
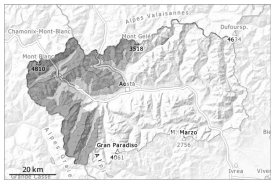
low	moderate	considerable	high	very high

Danger Level 3 - Considerable



Tendency: Constant avalanche danger
on Monday 09 02 2026



Wind slab

2300m

New snow

2000m

The deep wind slabs of Friday remain in some cases prone to triggering.

The wind slabs of Friday represent the main danger. They can be released by a single winter sport participant in some cases. Mostly they are shallow, caution is to be exercised in particular adjacent to ridgelines and in gullies and bowls, and on steep slopes in particular above the tree line.
On very steep shady slopes the avalanches can be triggered in deep layers of the snowpack. Slopes that have been little used this winter thus far are especially unfavourable.
Maintaining distances between individuals and one-at-a-time descents are recommended.
More natural avalanches are possible, even medium-sized ones.

Snowpack

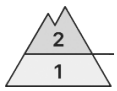
Danger patterns dp.6: cold, loose snow and wind

Friday: 10 to 30 cm of snow, and up to 40 cm in some localities, has fallen above approximately 1200 m. The fresh snow and especially the wind-blown snow drifts, both soft and hard, cover a thin layer of old snow and partly also surface hoar. In some cases the wind slabs have bonded poorly with the old snowpack.
Faceted weak layers exist in the old snowpack in particular on west, north and east facing slopes.

Tendency

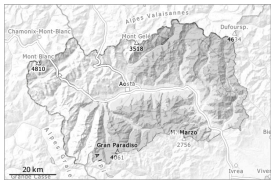
The weather conditions will facilitate a slow strengthening of the snowpack. Little snow will fall until Monday.

Danger Level 2 - Moderate



2100m

Tendency: Constant avalanche danger
on Monday 09 02 2026



Wind slab

2100m

Persistent weak layer

2100m

As you climb higher in altitude, danger spots are more widespread.

The fresh and somewhat older wind slabs represent the main danger.
Winter sport participants can release avalanches in some places. Mostly they are shallow. The avalanche prone locations are to be found in particular adjacent to ridgelines and in gullies and bowls and on steep, little used slopes.
In some places avalanches can also be triggered in the old snowpack. These are medium-sized and can mostly only be released by large loads.
Maintaining distances between individuals and one-at-a-time descents are recommended.
Small to medium-sized dry snow slides and avalanches are possible.

Snowpack

Danger patterns dp.6: cold, loose snow and wind | dp.1: deep persistent weak layer

Friday: 5 to 10 cm of snow fell during the night above approximately 1200 m.
The fresh snow and especially the wind-blown snow drifts, both soft and hard, cover a thin layer of old snow and partly also surface hoar.
Faceted weak layers exist in the old snowpack in particular on west, north and east facing slopes.

Tendency

The danger will persist. Little snow will fall until Monday.
