

Avalanche danger
updated on 3.5.2024, 17:00

region A

Considerable (3=)

New snow

Avalanche prone locations

Danger description

Large quantities of fresh snow and the wind-drifted snow of the last few days are prone to triggering. Single backcountry tourers can release avalanches easily, including large ones. Backcountry touring calls for experience in the assessment of avalanche danger and caution.

The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

Moderate (2)

Wet snow, Gliding snow

Avalanche prone locations

Danger description

As a consequence of warming during the day and solar radiation wet avalanches are to be expected. These can reach large size in isolated cases in southern Upper Valais and in western Ticino.

In addition gliding avalanches are possible. These can reach large size in isolated cases. Caution is to be exercised in areas with glide cracks.

region B

Considerable (3-)

New snow

Avalanche prone locations

Danger description

The new snow and wind slabs of the last few days are in some cases still prone to triggering. Single backcountry tourers can release avalanches easily. Avalanches can reach large size. Backcountry touring calls for experience in the assessment of avalanche danger.

The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

Moderate (2)

Wet snow, Gliding snow

Avalanche prone locations

Danger description

As a consequence of warming during the day and solar radiation wet avalanches are to be expected. These can reach large size in isolated cases in southern Upper Valais and in western Ticino.

In addition gliding avalanches are possible. These can reach large size in isolated cases. Caution is to be exercised in areas with glide cracks.

region C

Moderate (2=)

Wind slab

Avalanche prone locations

Danger description

Fresh and somewhat older wind slabs are in some cases prone to triggering. Avalanches can in some places be released by people. They can reach medium size.
Wind slabs are to be evaluated with care and prudence in very steep terrain.
The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

Moderate (2)

Wet snow, Gliding snow

Avalanche prone locations

Danger description

As a consequence of warming during the day and solar radiation wet avalanches are to be expected. These can reach large size in isolated cases in southern Upper Valais and in western Ticino.
In addition gliding avalanches are possible. These can reach large size in isolated cases. Caution is to be exercised in areas with glide cracks.

region D

Moderate (2)

Wet snow, Gliding snow

Avalanche prone locations

Danger description

As a consequence of warming during the day and solar radiation wet avalanches are to be expected. These can reach large size in isolated cases in southern Upper Valais and in western Ticino.
In addition gliding avalanches are possible. These can reach large size in isolated cases. Caution is to be exercised in areas with glide cracks.

Low (1)

No distinct avalanche problem

Individual avalanche prone locations for dry avalanches are to be found in particular in extremely steep terrain. Avalanches can in isolated cases reach medium size.
Apart from the danger of being buried, restraint should be exercised as well in view of the danger of avalanches sweeping people along and giving rise to falls.
The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

region E

Moderate (2)

Wet snow, Gliding snow

Avalanche prone locations

Danger description

As a consequence of warming during the day and solar radiation wet avalanches are to be expected. These can reach large size in isolated cases in southern Upper Valais and in western Ticino.
In addition gliding avalanches are possible. These can reach large size in isolated cases. Caution is to be exercised in areas with glide cracks.

region F

Low (1)

No distinct avalanche problem

Individual avalanche prone locations for dry avalanches are to be found in particular in extremely steep terrain. Avalanches can in isolated cases reach medium size.
Apart from the danger of being buried, restraint should be exercised as well in view of the danger of avalanches sweeping people along and giving rise to falls.
The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

Low (1)

Wet snow, Gliding snow

As the day progresses individual moist snow slides are possible.
In addition gliding avalanches are possible. These can reach large size in isolated cases.

region G

Low (1)

Wet snow, Gliding snow

As the day progresses individual moist snow slides are possible.
In addition gliding avalanches are possible. These can reach large size in isolated cases.

Snowpack and weather
