

Avalanche danger
updated on 20.11.2024, 17:00

region A

Considerable (3-)

New snow

Avalanche prone locations

Danger description

The new snow and wind slabs of the last two days are in some cases prone to triggering. As a consequence of a strong to storm force southwesterly wind, further wind slabs will form in the course of the day. Single winter sport participants can release avalanches. Avalanches can in some cases reach large size. This applies in particular on steep north and east facing slopes in high Alpine regions.
Snow sport activities outside marked and open pistes call for experience in the assessment of avalanche danger.

region B

Considerable (3-)

New snow

Avalanche prone locations

Danger description

The new snow and wind slabs of the last two days are in some cases prone to triggering. As a consequence of a strong to storm force southwesterly wind, further wind slabs will form in the course of the day. Single winter sport participants can release avalanches. Avalanches can in some cases reach large size. This applies in particular on steep north and east facing slopes in high Alpine regions. Snow sport activities outside marked and open pistes call for experience in the assessment of avalanche danger.

Moderate (2)

Wet snow

Avalanche prone locations

Danger description

As a consequence of the rain more frequent moist snow slides are possible in the afternoon, especially on very steep grassy slopes.

region C

Moderate (2-)

Wind slab

Avalanche prone locations

Danger description

As a consequence of new snow and a moderate to strong northwesterly wind, rather small wind slabs formed in particular in gullies and bowls. These are to be evaluated with care and prudence in particular in terrain where there is a danger of falling. The avalanches are small but in some cases easily released. The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

region D

Moderate (2-)

Wind slab

Avalanche prone locations

Danger description

Fresh and somewhat older wind slabs are to be evaluated with care and prudence. Mostly avalanches are small but in some cases easily released. The current avalanche situation calls for careful route selection.

region E

Moderate (2-)

Wind slab

Avalanche prone locations

Danger description

Fresh and somewhat older wind slabs are to be evaluated with care and prudence. Mostly avalanches are small but in some cases easily released. The current avalanche situation calls for careful route selection.

Moderate (2)

Wet snow

Avalanche prone locations

Danger description

As a consequence of the rain more frequent moist snow slides are possible in the afternoon, especially on very steep grassy slopes.

region F

Low (1)

Wind slab

Only a little snow is lying. Individual avalanche prone locations are to be found in particular in extremely steep terrain. Restraint should be exercised because avalanches can sweep people along and give rise to falls.

Snowpack and weather
