

Danger Level 2 - Moderate

Over a wide area warming.

In particular on steep sunny slopes loose snow avalanches are possible as a consequence of warming during the day and solar radiation. The wind slabs remain in some cases prone to triggering. The avalanche prone locations are to be found in particular at the base of rock walls and behind abrupt changes in the terrain and adjacent to ridgelines and in gullies and bowls. Medium-sized and, in isolated cases, large avalanches are possible. Avalanches can be released, mostly by large loads.

Snowpack
Weak layers exist in the snowpack in particular on shady slopes.

Tendency
The weather will be sunny.

Danger Level 2 - Moderate

Tendency: Constant avalanche danger
on Saturday 22 02 2025

Wind slab

Snowpack stability: **fair**

Frequency: **some**

Avalanche size: **medium**

Over a wide area warming.

The avalanche prone locations are to be found in particular adjacent to ridgelines and in gullies and bowls and at transitions from a shallow to a deep snowpack. Avalanches can be released by large loads. On sunny slopes loose snow avalanches are possible as a consequence of solar radiation.

Snowpack

Weak layers exist in the snowpack in particular on shady slopes.

Tendency

The weather will be sunny.
