

Avalanche danger
updated on 27.4.2024, 17:00

region A Considerable (3+)

New snow

Avalanche prone locations

Danger description

The large quantity of fresh snow and the sometimes large wind slabs represent the main danger. As a consequence of the heavy snowfall natural avalanches are possible, even large ones. Single persons can release avalanches easily. Backcountry touring and other off-piste activities call for experience in the assessment of avalanche danger and restraint.

Moderate (2)

Wet snow

Avalanche prone locations

Danger description

As a consequence of the rain wet avalanches are possible, in particular medium-sized ones. This applies in particular on north facing slopes.

region B

Considerable (3-)

Wind slab

Avalanche prone locations

Danger description

As a consequence of new snow and a strong to storm force southerly wind, avalanche prone wind slabs will form in particular at elevated altitudes. Avalanches can be released, even by a single winter sport participant and reach large size in isolated cases. Backcountry touring and other off-piste activities call for experience in the assessment of avalanche danger.

Moderate (2)

Wet snow

Avalanche prone locations

Danger description

As a consequence of the rain wet avalanches are possible, in particular medium-sized ones. This applies in particular on north facing slopes.

region C

Moderate (2+)

Wind slab

Avalanche prone locations

Danger description

As a consequence of a strong to storm force foehn wind, sometimes avalanche prone wind slabs will form in particular in gullies and bowls and behind abrupt changes in the terrain. They can be released by a single winter sport participant. Avalanches can reach medium size. The wind slabs in steep terrain are to be bypassed as far as possible.

Moderate (2)

Wet snow, Gliding snow

Avalanche prone locations

Danger description

More gliding avalanches are possible, even large ones in isolated cases. Caution is to be exercised in areas with glide cracks. As a consequence of solar radiation moist snow slides and avalanches are possible.

region D

Moderate (2+)

Wind slab

Avalanche prone locations

Danger description

As a consequence of a strong to storm force foehn wind, sometimes avalanche prone wind slabs will form in particular in gullies and bowls and behind abrupt changes in the terrain. They can be released by a single winter sport participant. Avalanches can reach medium size.
The wind slabs in steep terrain are to be bypassed as far as possible.

Low (1)

Gliding snow

On steep grassy slopes gliding avalanches and moist snow slides are possible, but they will be mostly small.
Caution is to be exercised in areas with glide cracks.

region E

Moderate (2=)

Wind slab

Avalanche prone locations

Danger description

As a consequence of a strong to storm force southerly wind, sometimes avalanche prone wind slabs will form in particular at elevated altitudes. These can be released by people. The fresh wind slabs are to be evaluated with care and prudence. Dry avalanches can in very isolated cases be released in near-surface layers also. Avalanches can reach medium size. Backcountry touring and other off-piste activities call for careful route selection.

Moderate (2)

Wet snow, Gliding snow

Avalanche prone locations

Danger description

More gliding avalanches are possible, even large ones in isolated cases. Caution is to be exercised in areas with glide cracks.
As a consequence of solar radiation moist snow slides and avalanches are possible.

region F

Moderate (2=)

New snow

Avalanche prone locations

Danger description

The new snow and wind slabs are in some cases prone to triggering. Avalanches can in some places be released by people, but they will be small in most cases. Apart from the danger of being buried, restraint should be exercised as well in view of the danger of avalanches sweeping people along and giving rise to falls.

Moderate (2)

Wet snow

Avalanche prone locations

Danger description

As a consequence of the rain wet avalanches are possible, in particular medium-sized ones. This applies in particular on north facing slopes.

region G

Moderate (2)

Wet snow

Avalanche prone locations

Danger description

As a consequence of the rain wet avalanches are possible, in particular medium-sized ones. This applies in particular on north facing slopes.

region H

Low (1)

Gliding snow

On steep grassy slopes gliding avalanches and moist snow slides are possible, but they will be mostly small. Caution is to be exercised in areas with glide cracks.
