

Avalanche danger
updated on 25.3.2024, 17:00

region A Considerable (3-)

Wind slab

Avalanche prone locations

Danger description

As a consequence of a strong to storm force southerly wind, sometimes large wind slabs will form also in areas not adjacent to ridgelines. In addition the wind slabs of the weekend are capable of being triggered in some cases still. Avalanches can be released, even by a single winter sport participant and reach medium size. Backcountry touring calls for experience in the assessment of avalanche danger and careful route selection.

Moderate (2)

Gliding snow

Avalanche prone locations

Danger description

In particular on steep grassy slopes more occasionally large gliding avalanches are possible. Areas with glide cracks are to be avoided.

region B

Considerable (3-)

Wind slab

Avalanche prone locations

Danger description

As a consequence of a strong to storm force southerly wind, sometimes large wind slabs will form also in areas not adjacent to ridgelines. In addition the wind slabs of the weekend are capable of being triggered in some cases still. Avalanches can be released, even by a single winter sport participant and reach medium size. Backcountry touring calls for experience in the assessment of avalanche danger and careful route selection.

Moderate (2)

Gliding snow

Avalanche prone locations

Danger description

In particular on steep grassy slopes more occasionally large gliding avalanches are possible. Areas with glide cracks are to be avoided.

region C

Moderate (2+)

Wind slab

Avalanche prone locations

Danger description

As a consequence of a strong to storm force southerly wind, avalanche prone wind slabs will form. Additionally in some places avalanches can also be released in near-surface layers of the snowpack. Avalanches can reach medium size. The number and size of avalanche prone locations will increase with altitude. Backcountry touring and other off-piste activities call for careful route selection.

Moderate (2)

Gliding snow

Avalanche prone locations

Danger description

In particular on steep grassy slopes more occasionally large gliding avalanches are possible. Areas with glide cracks are to be avoided.

region D

Moderate (2=)

Wind slab

Avalanche prone locations

Danger description

As a consequence of a strong southerly wind, avalanche prone wind slabs will form. The avalanche prone locations are to be found in particular adjacent to ridgelines and in gullies and bowls. Avalanches are rather small. The fresh wind slabs are to be evaluated with care and prudence in very steep terrain.

Moderate (2)

Gliding snow

Avalanche prone locations

Danger description

In particular on steep grassy slopes more occasionally large gliding avalanches are possible. Areas with glide cracks are to be avoided.

region E

Moderate (2=)

Wind slab

Avalanche prone locations

Danger description

As a consequence of a strong southerly wind, avalanche prone wind slabs will form. The avalanche prone locations are to be found in particular adjacent to ridgelines and in gullies and bowls. Avalanches are rather small. The fresh wind slabs are to be evaluated with care and prudence in very steep terrain.

Low (1)

Gliding snow

Individual gliding avalanches are possible, especially on steep grassy slopes. These can in some cases reach medium size. Areas with glide cracks are to be avoided as far as possible.

region F

Moderate (2=)

Wind slab

Avalanche prone locations

Danger description

As a consequence of new snow and a sometimes strong southerly wind, wind slabs will form. In the course of the day these will increase in size moderately. Additionally in isolated cases avalanches can also be released in near-surface layers of the snowpack and reach medium size. Careful route selection is important.

Moderate (2)

Gliding snow

Avalanche prone locations

Danger description

In particular on steep grassy slopes more occasionally large gliding avalanches are possible. Areas with glide cracks are to be avoided.

region G

Moderate (2)

Gliding snow

Avalanche prone locations

Danger description

In particular on steep grassy slopes more occasionally large gliding avalanches are possible. Areas with glide cracks are to be avoided.

Low (1)

Wind slab

As a consequence of new snow and a moderate southerly wind, mostly small wind slabs will form in the course of the day at elevated altitudes. The avalanche prone locations are to be found in particular in extremely steep terrain. Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls.

region H

Low (1)

Gliding snow
Individual gliding avalanches are possible, especially on steep grassy slopes. These can in some cases reach medium size. Areas with glide cracks are to be avoided as far as possible.

Snowpack and weather
