

Danger Level 2 - Moderate

Fresh wind slabs at high altitudes and in high Alpine regions. Moist loose snow avalanches are possible.

The wind slabs can still be released in particular on very steep shady slopes, in particular in gullies and bowls, and behind abrupt changes in the terrain.

Mostly small moist avalanches are possible as a consequence of warming during the day and solar radiation, in particular on very steep sunny slopes, and at the base of rock walls.

Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls.

Watch out for the numerous rocks hidden by the recent snow.

Snowpack

Danger patterns

dp.10: springtime scenario

dp.6: cold, loose snow and wind

The snowpack will be soft on shady slopes.

The surface of the snowpack has frozen to form a strong crust and will soften during the day. This applies on sunny slopes.

Snow depths vary greatly, depending on the influence of the wind.

Towards its base, the snowpack is faceted and weak, in particular on steep east, north and northwest facing slopes.

On sunny slopes below approximately 2400 m only a little snow is lying.

Tendency

The weather will be mild. The weather conditions will foster a gradual strengthening of the snowpack.

Danger Level 1 - Low

Tendency: Constant avalanche danger →
on Thursday 06 03 2025

Wet snow

2200m

Snowpack stability: **fair**

Frequency: **some**

Avalanche size: **small**

Wind slab

2200m

Snowpack stability: **fair**

Frequency: **few**

Avalanche size: **small**

In some localities increase in danger of moist and wet snow slides as a consequence of warming during the day.

Mostly small moist avalanches are possible as a consequence of warming during the day and solar radiation, in particular on very steep sunny slopes, and at the base of rock walls.

The mostly small wind slabs can be released in some cases in particular on very steep shady slopes.

Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls.

Watch out for the numerous rocks hidden by the recent snow.

Snowpack

Danger patterns

dp.10: springtime scenario

dp.6: cold, loose snow and wind

The surface of the snowpack has frozen to form a strong crust and will soften during the day. Sunshine and high temperatures will give rise as the day progresses to increasing moistening of the snowpack in particular on sunny slopes.

On sunny slopes below approximately 2400 m hardly any snow is lying.

Tendency

The weather will be mild. The weather conditions will foster a gradual strengthening of the snowpack.
