

Avalanche danger
updated on 10.1.2025, 17:00

region A

Considerable (3=)

Wind slab

Avalanche prone locations

Danger description

As a consequence of new snow and wind the wind slabs will increase in size once again. These are prone to triggering. Even single winter sport participants can release avalanches, including dangerously large ones. Backcountry touring and other off-piste activities call for experience in the assessment of avalanche danger.

region B

Considerable (3=)

Wind slab, Persistent weak layers

Avalanche prone locations

Danger description

The more recent wind slabs are prone to triggering. Even single winter sport participants can release avalanches, including medium-sized ones. Additionally in some places avalanches can also be released in the old snowpack and reach large size in isolated cases. Caution is to be exercised in particular in areas where the snow cover is rather shallow. Backcountry touring and other off-piste activities call for experience in the assessment of avalanche danger and careful route selection.

region C

Considerable (3-)

Wind slab

Avalanche prone locations

Danger description

The fresh and somewhat older wind slabs are in some cases prone to triggering. Avalanches can be released, even by a single winter sport participant and reach medium size.
Backcountry touring and other off-piste activities call for experience in the assessment of avalanche danger.

region D

Considerable (3-)

Wind slab, Persistent weak layers

Avalanche prone locations

Danger description

Fresh and somewhat older wind slabs are in some cases prone to triggering. Additionally in some places avalanches can be released in the old snowpack and reach medium size. These avalanche prone locations are to be found especially on very steep north facing slopes above approximately 2600 m.
Backcountry touring calls for experience in the assessment of avalanche danger.

region E

Considerable (3-)

Wind slab, Persistent weak layers

Avalanche prone locations

Danger description

Avalanches can be released in the old snowpack and reach medium size. These avalanche prone locations are barely recognisable, even to the trained eye. Caution is to be exercised in particular in areas where the snow cover is rather shallow in places that are protected from the wind.
In addition the fresh wind slabs are prone to triggering. Backcountry touring and other off-piste activities call for experience in the assessment of avalanche danger and careful route selection.

region F

Moderate (2+)

Wind slab

Avalanche prone locations

Danger description

Fresh and somewhat older wind slabs represent the main danger. These avalanche prone locations are to be found especially adjacent to ridgelines and in gullies and bowls. Avalanches can in some places be released by people, but they will be small in most cases. Backcountry touring and snowshoe hiking call for careful route selection.

region G

Moderate (2+)

Wind slab, Persistent weak layers

Avalanche prone locations

Danger description

Fresh and somewhat older wind slabs represent the main danger. These avalanche prone locations are to be found especially adjacent to ridgelines and in gullies and bowls. Additionally in some places avalanches can be released in the old snowpack and reach medium size. Backcountry touring calls for experience in the assessment of avalanche danger.

region H

Low (1)

Wind slab

As a consequence of new snow and a moderate westerly wind, wind slabs will form during the night in some localities. These are to be evaluated with care and prudence especially in terrain where there is a danger of falling.

region I

Low (1)

No distinct avalanche problem

Individual avalanche prone locations are to be found on extremely steep slopes above approximately 1600 m. Even a small avalanche can sweep people along and give rise to falls.
