

Avalanche danger
updated on 22.11.2024, 17:00

region A

Considerable (3-)

New snow

Avalanche prone locations

Danger description

The new snow and wind slabs of the last three days can be released by a single winter sport participant. Mostly avalanches are medium-sized.
High Alpine regions: Additionally avalanches can be released in near-ground layers and reach large size, especially on steep north and east facing slopes. Backcountry touring and other off-piste activities call for experience in the assessment of avalanche danger. The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

region B

Moderate (2+)

Wind slab

Avalanche prone locations

Danger description

The new snow and wind slabs of the last three days can be released by a single winter sport participant. In isolated cases avalanches are medium-sized and in some cases easily released. The wind slabs are to be evaluated with care and prudence in very steep terrain. The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

Low (1)

Wet snow

In particular on cut and grassy slopes mostly small gliding avalanches and moist snow slides are to be expected. Restraint should be exercised because avalanches can sweep people along and give rise to falls.

region C

Moderate (2=)

Wind slab

Avalanche prone locations

Danger description

Thus far only a little snow is lying. The clearly visible wind slabs of the last few days are in some cases still prone to triggering. They are to be found in particular in gullies and bowls. Mostly avalanches are small but in some cases easily released. The wind slabs are to be evaluated with care and prudence in particular in terrain where there is a danger of falling. The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

region D

Low (1)

Wind slab

The wind slabs of the last few days are in isolated cases prone to triggering. Individual avalanche prone locations are to be found in particular in extremely steep terrain and in gullies and bowls. Restraint should be exercised because avalanches can sweep people along and give rise to falls.

region E

Low (1)

Wind slab
The wind slabs of the last few days are in isolated cases prone to triggering. Individual avalanche prone locations are to be found in particular in extremely steep terrain and in gullies and bowls.
Restraint should be exercised because avalanches can sweep people along and give rise to falls.

Low (1)

Wet snow
In particular on cut and grassy slopes mostly small gliding avalanches and moist snow slides are to be expected. Restraint should be exercised because avalanches can sweep people along and give rise to falls.
