

Avalanche danger
updated on 13.3.2025, 17:00

region A

Considerable (3+)

New snow, Persistent weak layers

Avalanche prone locations

Danger description

Large quantities of fresh snow and the wind-drifted snow are lying on the unfavourable surface of an old snowpack. Avalanches can be released, even by a single winter sport participant. Individual natural avalanches are to be expected, in particular during the night. In some places avalanches can also be triggered in deep layers and reach large size. Backcountry touring calls for experience in the assessment of avalanche danger and restraint.

region B

Considerable (3=)

New snow, Persistent weak layers

Avalanche prone locations

Danger description

The new snow and wind slabs of the last few days are lying on the unfavourable surface of an old snowpack, in particular on steep shady slopes. Avalanches can be released, even by a single winter sport participant. Individual natural avalanches are possible, in particular during the night.
In some places avalanches can also be triggered in deep layers and reach large size.
Backcountry touring calls for experience in the assessment of avalanche danger.

region C

Considerable (3-)

Wind slab, Persistent weak layers

Avalanche prone locations

Danger description

The new snow and wind slabs of the last few days are lying on the unfavourable surface of an old snowpack in particular on shady slopes. Avalanches can be released by a single winter sport participant and reach medium size. In isolated cases avalanches can also be triggered in deep layers.
Backcountry touring calls for experience in the assessment of avalanche danger.

region D

Considerable (3-)

New snow, Persistent weak layers

Avalanche prone locations

Danger description

The new snow of the last few days is lying on top of a weakly bonded old snowpack, in particular on steep shady slopes. Avalanches can be released, even by a single winter sport participant. In some places avalanches can also be triggered in deep layers and reach large size.
Backcountry touring calls for experience in the assessment of avalanche danger.

region E

Moderate (2=)

Wind slab

Avalanche prone locations

Danger description

Fresh and somewhat older wind slabs are to be evaluated with care and prudence in particular in very steep terrain. They will be covered with new snow in some cases and therefore difficult to recognise. Avalanches can reach medium size. Backcountry touring calls for careful route selection.

region F

Moderate (2=)

Wind slab, Persistent weak layers

Avalanche prone locations

Danger description

The fresh and older wind slabs can be released easily in some cases. The wind slabs will be covered with new snow in some cases and therefore difficult to recognise. Avalanches can reach medium size. In isolated cases avalanches can also penetrate deep layers. Backcountry touring calls for careful route selection.

region G

Low (1)

Wind slab

As a consequence of southwesterly wind, small wind slabs formed. They are in isolated cases prone to triggering. They are to be evaluated with care and prudence in particular in extremely steep terrain. Even a small avalanche can sweep people along and give rise to falls.
