

Danger Level 1 - Low

Tendency: Constant avalanche danger →
on Wednesday 30 04 2025

Wet snow

Snowpack stability: **very poor**

Frequency: **few**

Avalanche size: **small**

Moist and wet avalanches are the main danger.

Above approximately 2000 m mostly small natural wet avalanches are possible. The avalanche prone locations are to be found especially in gullies and bowls and on very steep slopes.

Snowpack

Danger patterns

dp.10: springtime scenario

At low and intermediate altitudes no snow is lying. At elevated altitudes the snowpack is subject to significant local variations. The older wind slabs are to be found especially in gullies and bowls and in the high Alpine regions. The old snowpack remains moist in high Alpine regions. The weather conditions will give rise to increasing and thorough wetting of the snowpack.
