

## Danger Level 1 - Low

**Tendency: Constant avalanche danger** →  
on Thursday 27 03 2025

Wet snow

1800m

Snowpack stability: **very poor**

Frequency: **few**

Avalanche size: **small**

### Wet snow slides and avalanches are the main danger.

Adjacent to ridgelines and in gullies and bowls and above approximately 1900 m wet snow slides and avalanches are possible, but they will be mostly small. Individual medium-sized avalanches are not entirely ruled out.

### Snowpack

A little new snow above approximately 1800 m. The old wind slabs are to be found especially in gullies and bowls and generally in the high Alpine regions.
