Tendency: Constant avalanche danger →

on Thursday 01 05 2025

Wet snow

3000m

Snowpack stability: **poor**

Frequency: **some**

Avalanche size: **small**

Gradual increase in danger of wet avalanches as a consequence of warming during the day and solar radiation.

A clear night will be followed in the early morning by favourable conditions generally.

As a consequence of warming during the day and the solar radiation, the likelihood of wet avalanches being released will increase. Mostly they are only small but can be released even by a single winter sport participant. The avalanche prone locations are to be found especially on very steep west, north and east facing slopes below approximately 3000 m and on very steep south facing slopes above approximately 3000 m.

Somewhat older wind slabs are now only very rarely prone to triggering. Very isolated avalanche prone locations are to be found in particular on extremely steep shady slopes in high Alpine regions and adjacent to ridgelines. Mostly avalanches are only small.

The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality. Wet avalanches can be released by a single winter sport participant, but they will be small in most cases.

Snowpack

Danger patterns

dp.10: springtime scenario

Over a wide area a clear night. The surface of the snowpack will freeze to form a strong crust and will already soften in the late morning. In steep terrain there is a danger of falling on the hard crust. The old snowpack is wet. This applies on shady slopes at intermediate and high altitudes, as well as on sunny slopes in high Alpine regions.

Tendency

A clear night will be followed in the early morning by favourable conditions generally, but the danger of wet avalanches will increase later.

Danger Level 1 - Low

Tendency: Constant avalanche danger →
on Thursday 01 05 2025

Low avalanche danger will prevail.

Only isolated avalanches are possible.

Snowpack

A partly clear night. The surface of the snowpack will freeze very little and will soften quickly. The old snowpack will be wet all the way through.

A little snow is lying.

Tendency

Only isolated avalanches are possible.
