

Avalanche danger  
updated on 24.11.2024, 17:00

region A

Considerable (3-)

Wind slab

Avalanche prone locations

Danger description

The fresh and older wind slabs are in some cases prone to triggering. Whumpfung sounds can indicate the danger. Avalanches can reach medium size.  
High Alpine regions: Avalanches can in some cases be released in near-ground layers and reach large size in isolated cases.  
Backcountry touring and other off-piste activities call for experience in the assessment of avalanche danger.  
The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

Low (1)

Gliding snow

In particular on cut and grassy slopes mostly small gliding avalanches and moist snow slides are to be expected. Areas with glide cracks are to be avoided.

region B

Moderate (2+)

Wind slab

Avalanche prone locations

Danger description

The fresh and older wind slabs are in some cases prone to triggering. Avalanches can reach medium size. Backcountry touring and other off-piste activities call for careful route selection.

High Alpine regions: Avalanches can in some cases be released in near-ground layers and reach large size in isolated cases. Here the avalanche prone locations are more prevalent and the danger is slightly greater.

The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

Low (1)

Gliding snow

In particular on cut and grassy slopes mostly small gliding avalanches and moist snow slides are to be expected. Areas with glide cracks are to be avoided.

region C

Moderate (2-)

Wind slab

Avalanche prone locations

Danger description

Thus far only a little snow is lying. The fresh wind slabs are in some cases prone to triggering. They are to be found in particular in gullies and bowls. Mostly avalanches are small. The wind slabs are to be evaluated with care and prudence in particular in very steep terrain.

The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

region D

Moderate (2-)

Wind slab

Avalanche prone locations

Danger description

Thus far only a little snow is lying. The fresh wind slabs are in some cases prone to triggering. They are to be found in particular in gullies and bowls. Mostly avalanches are small. The wind slabs are to be evaluated with care and prudence in particular in very steep terrain.  
The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

Low (1)

Gliding snow

In particular on cut and grassy slopes mostly small gliding avalanches and moist snow slides are to be expected. Areas with glide cracks are to be avoided.

region E

Moderate (2-)

Wind slab

Avalanche prone locations

Danger description

As a consequence of a strong foehn wind, further wind slabs will form at elevated altitudes. In addition the wind slabs of the last few days are prone to triggering in isolated cases still. Mostly avalanches are small. The wind slabs are to be evaluated with care and prudence in very steep terrain.  
The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

Low (1)

Gliding snow

In particular on cut and grassy slopes mostly small gliding avalanches and moist snow slides are to be expected. Areas with glide cracks are to be avoided.

region F

Low (1)

Gliding snow

In particular on cut and grassy slopes mostly small gliding avalanches and moist snow slides are to be expected. Areas with glide cracks are to be avoided.

## Snowpack and weather

updated on 24.11.2024, 17:00

### Snowpack

Below 2800 m, the snow of the past week fell widely on bare ground or on north-facing slopes at higher altitudes, partly on a thin old snowpack of angular crystals. Because this thin layer of old snow has not yet filled in the roughness of the terrain, hardly any widespread avalanches are expected. The avalanche danger is therefore mainly due to the fresh and older wind slabs.

Above approximately 2800 metres, on the other hand, the snow fell mainly on northern slopes on an often contiguous old snowpack. Where the old snowpack meets last week's snow, there is a weak layer of angular crystals in places.

Occasionally, avalanches can be released in this layer.

With the mild temperatures and the foehn wind, the snowpack was moistened to intermediate altitudes and on sunny slopes up to high altitudes.

### Weather review for Sunday, 24.11.2024

With often dense high cloud fields, it was only sunny at times.

#### Fresh snow

-

#### Temperature

Very mild in the north;

at midday at 2000 m, between +8 °C in the north and -2 °C in the south.

#### Wind

- Moderate to strong southwesterly winds
- Moderate foehn wind in the alpine valleys of the north

### Weather forecast until Monday, 25.11.2024

It will be mostly sunny in the north before clouds move in from the west in the afternoon. It will be overcast in the south.

#### Fresh snow

-

#### Temperature

In the north it will continue to remain very mild;

at midday at 2000 m, between +10 °C in the north and 0 °C in the south.

#### Wind

There will be southwesterly winds

- Moderate, increasingly strong to stormy in the west and north at high altitudes
- Strong to storm-force foehn winds in the Alpine valleys of the north.

## Outlook

### Tuesday

During the night to Tuesday there will be widespread precipitation, about 20 cm in the far west. The snowfall level will drop from around 2400 m to 1600 m from the west. In the south, it will remain at 1800 metres. During the day it will be partly sunny in the west and south, otherwise it will be very cloudy. On Monday evening in the west, the wind will still be strong to stormy from the southwest. It will decrease appreciably during the night.

The danger of dry avalanches may increase slightly in some regions with the new snow. Due to falling temperatures, the danger of wet avalanches will decrease appreciably.

### Wednesday

On Wednesday, it will be quite sunny. The wind will be light to moderate from the southwest. The temperature in the middle of the day at 2000 m will be +2 °C.

The avalanche danger will decrease.
