

Avalanche danger
updated on 20.2.2025, 17:00

region A

Moderate (2=)

Persistent weak layers

Avalanche prone locations

Danger description

Avalanches can in isolated cases be released in the old snowpack and reach quite a large size. Such avalanche prone locations are rare but are barely recognisable, even to the trained eye. Avalanche prone locations are to be found in particular in little used backcountry terrain, especially on very steep north facing slopes. In addition the somewhat older wind slabs should be taken into account. Backcountry touring calls for careful route selection.

Moderate (2)

Gliding snow

In particular on steep sunny slopes individual gliding avalanches are possible below approximately 2400 m. These can reach large size. Caution is to be exercised in areas with glide cracks. As a consequence of warming during the day and solar radiation moist snow slides are possible.

region B

Moderate (2=)

Persistent weak layers

Avalanche prone locations

Danger description

Avalanches can in isolated cases be released in the old snowpack and reach quite a large size. Such avalanche prone locations are rare but are barely recognisable, even to the trained eye. Avalanche prone locations are to be found in particular in little used backcountry terrain, especially on very steep north facing slopes. In addition the somewhat older wind slabs should be taken into account. Backcountry touring calls for careful route selection.

region C

Moderate (2-)

No distinct avalanche problem

Avalanche prone locations

Danger description

A generally favourable avalanche situation will prevail. Avalanches can in some places be released in near-surface layers by people. They can reach medium size. Such avalanche prone locations are rare but are barely recognisable, even to the trained eye. They are to be found in particular on very steep shady slopes. Backcountry touring calls for meticulous route selection.

Moderate (2)

Gliding snow

In particular on steep sunny slopes individual gliding avalanches are possible below approximately 2400 m. These can reach large size. Caution is to be exercised in areas with glide cracks. As a consequence of warming during the day and solar radiation moist snow slides are possible.

region D

Moderate (2-)

No distinct avalanche problem

Avalanche prone locations

Danger description

A generally favourable avalanche situation will prevail. Avalanches can in some places be released in near-surface layers by people. They can reach medium size. Such avalanche prone locations are rare but are barely recognisable, even to the trained eye. They are to be found in particular on very steep shady slopes. Backcountry touring calls for careful route selection.

Moderate (2)

Gliding snow

In particular on steep sunny slopes individual gliding avalanches are possible below approximately 2400 m. These can reach large size. Caution is to be exercised in areas with glide cracks.
As a consequence of warming during the day and solar radiation moist snow slides are possible.

region E

Moderate (2-)

No distinct avalanche problem

Avalanche prone locations

Danger description

A generally favourable avalanche situation will prevail. Avalanches can in some places be released in near-surface layers by people. They can reach medium size. Such avalanche prone locations are rare but are barely recognisable, even to the trained eye. They are to be found in particular on very steep shady slopes. Backcountry touring calls for careful route selection.

Low (1)

Gliding snow

In particular on steep south facing slopes individual gliding avalanches are possible below approximately 2400 m. Caution is to be exercised in areas with glide cracks.
As a consequence of warming during the day and solar radiation moist snow slides are possible.

region F

Moderate (2-)

No distinct avalanche problem

Avalanche prone locations

Danger description

A generally favourable avalanche situation will prevail. Avalanches can in some places be released in near-surface layers by people. They can reach medium size. Such avalanche prone locations are rare but are barely recognisable, even to the trained eye. They are to be found in particular on very steep shady slopes. Backcountry touring calls for meticulous route selection.

Low (1)

Gliding snow

In particular on steep south facing slopes individual gliding avalanches are possible below approximately 2400 m. Caution is to be exercised in areas with glide cracks. As a consequence of warming during the day and solar radiation moist snow slides are possible.

region G

Moderate (2-)

No distinct avalanche problem

Avalanche prone locations

Danger description

A generally favourable avalanche situation will prevail. Avalanches can in some places be released in near-surface layers by people. They can reach medium size. Such avalanche prone locations are rare but are barely recognisable, even to the trained eye. They are to be found in particular on very steep shady slopes. Backcountry touring calls for meticulous route selection.

region H

Low (1)

No distinct avalanche problem

Individual avalanche prone locations are to be found in particular in extremely steep terrain. Even a small avalanche can sweep people along and give rise to falls.

Snowpack and weather
