Tendency: Constant avalanche danger on Saturday 10 05 2025

New snow

2700m

Snowpack stability: poor

Frequency: some

Avalanche size: medium

Wet snow

2700m  
2100m

Snowpack stability: poor

Frequency: some

Avalanche size: medium

New snow and wet snow represent the main danger.

Above approximately 2400 m snow will fall until late morning over a wide area. Above approximately 2800 m the avalanche prone locations are more prevalent and the danger is greater.

Small and medium-sized natural avalanches are possible, in the event of prolonged bright spells in particular at high altitudes and in high Alpine regions and, in the regions exposed to heavier precipitation especially.

The new snow can be released in some cases. Backcountry tourers can release avalanches in some places, including medium-sized ones, in particular on very steep slopes.

Moist and wet avalanches.

Outgoing longwave radiation during the night will be reduced in some case. Increase in danger as a consequence of warming during the day and solar radiation, especially at the base of rock walls and behind abrupt changes in the terrain on very steep sunny slopes. The danger of moist and wet avalanches will increase from midday, in the regions exposed to heavier precipitation in particular below approximately 2700 m.

The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

Snowpack

Danger patterns

dp.10: springtime scenario

10 to 25 cm of snow, and even more in some localities, has fallen since Tuesday above approximately 2600

m. The wind was moderate in the vicinity of peaks in particular in the southeast and in the northeast. Over a wide area 5 to 15 cm of snow, and even more in some localities, will fall until Friday above approximately 2300 m. Up to high altitudes rain will fall.

In some regions rain to the high Alpine regions: These weather conditions gave rise to moistening of the snowpack also at high altitude. Below approximately 2600 m the snowpack is wet all the way through. In particular sunny slopes and south and east facing slopes: In many cases new snow is lying on a hard crust.

Below approximately 2200 m a little snow is lying.

## Tendency

The avalanche danger will persist.
