

Avalanche danger  
updated on 24.4.2025, 17:00

region A

Considerable (3-)

New snow

Avalanche prone locations

Danger description

The fresh snow and the wind slabs that are being formed by the moderate westerly wind are prone to triggering. Winter sport participants can release avalanches in some places, including medium-sized ones.  
Backcountry touring calls for experience in the assessment of avalanche danger.

Low (1)

Wet snow, Gliding snow

On very steep slopes individual gliding avalanches and moist snow slides are possible. Even a small avalanche can sweep people along and give rise to falls.

region B

Considerable (3-)

New snow, Wind slab

Avalanche prone locations

Danger description

The fresh snow and the wind slabs that are being formed by the moderate to strong northerly wind are prone to triggering. Avalanches can be released easily and reach medium size. Backcountry touring calls for experience in the assessment of avalanche danger.

Moderate (2)

Wet snow, Gliding snow

As a consequence of warming during the day and solar radiation medium-sized and large wet and gliding avalanches are possible. Caution is to be exercised in particular on west and east facing slopes below approximately 3000 m, as well as on north facing slopes below approximately 2600 m. In addition in all aspects, small to medium-sized moist loose snow avalanches are possible. Backcountry tours should be concluded timely.

region C

Moderate (2+)

New snow

Avalanche prone locations

Danger description

The fresh snow and in particular the wind slabs that are forming at elevated altitudes are in some cases prone to triggering. Winter sport participants can release avalanches in some places, including medium-sized ones. Backcountry touring calls for careful route selection.

Low (1)

Wet snow, Gliding snow

On very steep slopes individual gliding avalanches and moist snow slides are possible. Even a small avalanche can sweep people along and give rise to falls.

region D

Moderate (2+)

Wind slab

Avalanche prone locations

Danger description

The fresh and older wind slabs are in some cases prone to triggering. Avalanches can reach medium size. Avalanches can additionally be released in deep layers in very isolated cases, this applies in particular in case of a large load. Avalanches can reach very large size. Backcountry touring and other off-piste activities call for defensive route selection.

Moderate (2)

Wet snow, Gliding snow

As a consequence of warming during the day and solar radiation medium-sized and large wet and gliding avalanches are possible. Caution is to be exercised in particular on west and east facing slopes below approximately 3000 m, as well as on north facing slopes below approximately 2600 m. In addition in all aspects, small to medium-sized moist loose snow avalanches are possible. Backcountry tours should be concluded timely.

region E

Moderate (2+)

Wind slab

Avalanche prone locations

Danger description

As a consequence of a moderate to strong northerly wind, avalanche prone wind slabs will form. These are to be evaluated with care and prudence in steep terrain. Additionally in very isolated cases avalanches can be released in the old snowpack. Caution is to be exercised in particular on very steep shady slopes in little used backcountry terrain. Avalanches can reach medium size. Careful route selection is required.

Low (1)

Wet snow, Gliding snow

On very steep slopes individual gliding avalanches and moist snow slides are possible. Even a small avalanche can sweep people along and give rise to falls.

region F

Moderate (2+)

Wind slab

Avalanche prone locations

Danger description

As a consequence of a moderate to strong northerly wind, avalanche prone wind slabs will form. These are to be evaluated with care and prudence in steep terrain. Additionally in very isolated cases avalanches can be released in the old snowpack. Caution is to be exercised in particular on very steep shady slopes in little used backcountry terrain. Avalanches can reach medium size. Careful route selection is required.

Moderate (2)

Wet snow, Gliding snow

As a consequence of warming during the day and solar radiation medium-sized and large wet and gliding avalanches are possible. Caution is to be exercised in particular on west and east facing slopes below approximately 3000 m, as well as on north facing slopes below approximately 2600 m. In addition in all aspects, small to medium-sized moist loose snow avalanches are possible. Backcountry tours should be concluded timely.

region G

Moderate (2=)

Wind slab

Avalanche prone locations

Danger description

As a consequence of new snow and a moderate northerly wind, mostly small wind slabs will form. These are to be evaluated with care and prudence in very steep terrain. In high Alpine regions these avalanche prone locations are present in all aspects. Additionally in very isolated cases dry avalanches can be released in the old snowpack and reach medium size. Caution is to be exercised in particular on extremely steep shady slopes in little used backcountry terrain.

Low (1)

Wet snow, Gliding snow

On very steep slopes individual gliding avalanches and moist snow slides are possible. Even a small avalanche can sweep people along and give rise to falls.

## region H

## Moderate (2=)

### Wind slab

#### Avalanche prone locations

#### Danger description

As a consequence of new snow and a moderate northerly wind, mostly small wind slabs will form. These are to be evaluated with care and prudence in very steep terrain. In high Alpine regions these avalanche prone locations are present in all aspects. Additionally in very isolated cases dry avalanches can be released in the old snowpack and reach medium size. Caution is to be exercised in particular on extremely steep shady slopes in little used backcountry terrain.

## Moderate (2)

### Wet snow, Gliding snow

As a consequence of warming during the day and solar radiation medium-sized and large wet and gliding avalanches are possible. Caution is to be exercised in particular on west and east facing slopes below approximately 3000 m, as well as on north facing slopes below approximately 2600 m. In addition in all aspects, small to medium-sized moist loose snow avalanches are possible. Backcountry tours should be concluded timely.

## region I

## Moderate (2-)

### No distinct avalanche problem

#### Avalanche prone locations

#### Danger description

Dry avalanches can be released in near-surface layers in isolated cases. They can in isolated cases reach medium size. In high Alpine regions small wind slabs will form. These are to be evaluated with care and prudence in terrain where there is a danger of falling. These avalanche prone locations are to be found in particular on very steep north facing slopes and adjacent to ridgelines and in pass areas in all aspects. Careful route selection is recommended.

## Low (1)

### Wet snow, Gliding snow

On very steep slopes individual gliding avalanches and moist snow slides are possible. Even a small avalanche can sweep people along and give rise to falls.

region J

Moderate (2-)

No distinct avalanche problem

Avalanche prone locations

Danger description

Dry avalanches can be released in near-surface layers in isolated cases. They can in isolated cases reach medium size.  
In high Alpine regions small wind slabs will form. These are to be evaluated with care and prudence in terrain where there is a danger of falling. These avalanche prone locations are to be found in particular on very steep north facing slopes and adjacent to ridgelines and in pass areas in all aspects.  
Careful route selection is recommended.

Moderate (2)

Wet snow, Gliding snow

As a consequence of warming during the day and solar radiation medium-sized and large wet and gliding avalanches are possible. Caution is to be exercised in particular on west and east facing slopes below approximately 3000 m, as well as on north facing slopes below approximately 2600 m. In addition in all aspects, small to medium-sized moist loose snow avalanches are possible.  
Backcountry tours should be concluded timely.

region K

Moderate (2)

Wet snow, Gliding snow

As a consequence of warming during the day and solar radiation medium-sized and large wet and gliding avalanches are possible. Caution is to be exercised in particular on west and east facing slopes below approximately 3000 m, as well as on north facing slopes below approximately 2600 m. In addition in all aspects, small to medium-sized moist loose snow avalanches are possible.  
Backcountry tours should be concluded timely.

region L

Low (1)

Wet snow, Gliding snow

On very steep slopes individual gliding avalanches and moist snow slides are possible. Even a small avalanche can sweep people along and give rise to falls.

## Snowpack and weather
