

## Danger Level 2 - Moderate

**Tendency: Constant avalanche danger** →  
on Thursday 08 05 2025

Wet snow

2000m

Snowpack stability: **poor**

Frequency: **few**

Avalanche size: **medium**

Slight decrease in danger of moist and wet avalanches as the temperature drops.

In some regions 5 cm of snow, and even more in some localities, will fall until the afternoon above approximately 2000 m.

Slight decrease in danger of moist and wet avalanches as the temperature drops.

Very steep slopes high altitudes and the high Alpine regions: The new snow must be evaluated with care and prudence. Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls.

## Snowpack

### Danger patterns

dp.10: springtime scenario

dp.3: rain

In some regions 5 cm of snow, and even more in some localities, will fall until the afternoon above approximately 2000 m. In some places new snow is lying on a moist old snowpack.

The surface of the snowpack is frozen, but not to a significant depth and will soften later than the day before.

Below approximately 2000 m hardly any snow is lying.

## Tendency

As a consequence of falling temperatures, the activity of moist and wet avalanches will gradually decrease.

## Danger Level 2 - Moderate

The new snow must be evaluated with care and prudence at high altitudes and in high Alpine regions.

Over a wide area 5 to 15 cm of snow, and up to 30 cm in some localities, will fall until the afternoon above approximately 2000 m.

In the regions exposed to heavier precipitation the situation is more precarious. The avalanche prone locations are to be found on steep slopes of all aspects above approximately 2300 m and adjacent to ridgelines and in gullies and bowls. The new snow can be released by a single winter sport participant in some cases. Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls.

Below approximately 2300 m mostly small moist loose snow avalanches are possible.

### Snowpack

Over a wide area 5 to 15 cm of snow, and up to 30 cm in some localities, will fall until the afternoon above approximately 2000 m.

Also below approximately 2800 m: In many cases new snow is lying on a moist old snowpack. In particular sunny slopes and south and east facing slopes: New snow is lying on a hard crust.

Below approximately 1900 m hardly any snow is lying.

## Danger Level 1 - Low

**Tendency: Constant avalanche danger** →  
on Thursday 08 05 2025

Wet snow

2200m

Snowpack stability: **poor**

Frequency: **few**

Avalanche size: **small**

At low and intermediate altitudes only a little snow is lying. Individual avalanche prone locations are to be found on very steep slopes in high Alpine regions.

At low and intermediate altitudes only a little snow is lying.

Isolated mostly small moist avalanches are possible as the moisture increases.

Individual avalanche prone locations are to be found on very steep slopes above approximately 2400 m.

## Snowpack

### Danger patterns

dp.10: springtime scenario

On south and southeast facing slopes in all altitude zones hardly any snow is lying. This also applies at low and intermediate altitudes.

High altitudes and the high Alpine regions: The snowpack consists of faceted crystals and its surface has a crust that is barely capable of bearing a load.
