

Avalanche danger
updated on 11.4.2024, 17:00

Morning

As the day progresses

region A

Moderate (2+) Dry avalanches, whole day

Wind slab

Avalanche prone locations

Danger description

The wind slabs of the last few days are in some cases still prone to triggering. The avalanche prone locations are to be found in particular on steep shady slopes at elevated altitudes. Single persons can release avalanches. These can reach medium size. Off-piste activities call for meticulous route selection.

Considerable (3) Wet-snow avalanches, as the day progresses

Wet snow, Gliding snow

Avalanche prone locations

Danger description

As a consequence of warming during the day and solar radiation more frequent moist avalanches are to be expected as the day progresses, even large ones in isolated cases. In addition medium-sized and large gliding avalanches are to be expected. This applies in particular on steep grassy slopes. Areas with glide cracks are to be avoided.

region B

Moderate (2-) Dry avalanches, whole day

Wind slab

Avalanche prone locations

Danger description

The wind slabs of the last few days are in some cases still prone to triggering. Avalanche prone locations for dry avalanches are to be found in particular in gullies and bowls and on steep shady slopes. Single persons can release avalanches. These can in isolated cases reach medium size. Meticulous route selection is recommended.

Considerable (3) Wet-snow avalanches, as the day progresses

Wet snow, Gliding snow

Avalanche prone locations

Danger description

As a consequence of warming during the day and solar radiation more frequent moist avalanches are to be expected as the day progresses, even large ones in isolated cases. In addition medium-sized and large gliding avalanches are to be expected. This applies in particular on steep grassy slopes. Areas with glide cracks are to be avoided.

region C

Low (1) Dry avalanches, whole day

No distinct avalanche problem

Individual avalanche prone locations for dry avalanches are to be found in particular in extremely steep terrain at high altitude. Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls.

Considerable (3) Wet-snow avalanches, as the day progresses

Wet snow, Gliding snow

Avalanche prone locations

Danger description

As a consequence of warming during the day and solar radiation more frequent moist avalanches are to be expected as the day progresses, even large ones in isolated cases. In addition medium-sized and large gliding avalanches are to be expected. This applies in particular on steep grassy slopes. Areas with glide cracks are to be avoided.

region D

Low (1) Dry avalanches, whole day

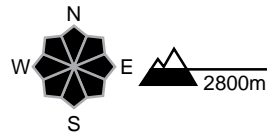

No distinct avalanche problem

Individual avalanche prone locations for dry avalanches are to be found in particular in extremely steep terrain at high altitude. Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls.

Moderate (2) Wet-snow avalanches, as the day progresses

Wet snow, Gliding snow

Avalanche prone locations

Danger description

As a consequence of warming during the day and solar radiation more frequent moist snow slides and avalanches are to be expected as the day progresses. In addition medium-sized and, in isolated cases, large gliding avalanches are possible. This applies in particular on steep grassy slopes. Areas with glide cracks are to be avoided.

region E

Low (1) Dry avalanches, whole day

No distinct avalanche problem

Individual avalanche prone locations for dry avalanches are to be found in particular in extremely steep terrain at high altitude. Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls.

Low (1) Wet-snow avalanches, whole day

Wet snow, Gliding snow

In particular on very steep slopes individual gliding avalanches and wet snow slides are possible. Gliding avalanches can in some cases reach medium size. Areas with glide cracks are to be avoided as far as possible.

region F

Low (1) Wet-snow avalanches, whole day

Wet snow, Gliding snow

In particular on very steep slopes individual gliding avalanches and wet snow slides are possible. Gliding avalanches can in some cases reach medium size. Areas with glide cracks are to be avoided as far as possible.

Snowpack and weather

updated on 11.4.2024, 17:00

Snowpack

New snow and wind slabs from the middle of the week have increasingly settled. Avalanche-prone locations are now to be found mainly on steep shady slopes. Hardly any fractures deeper in the snowpack are to be expected.

As a consequence of solar radiation and the rise in temperatures, the surface of the snowpack has been moistened up to over 3000 m on south-facing slopes and up to around 2600 m on north-facing slopes. With the clear night, a crust will form in these locations. In these altitude zones, even the deeper layers of the snowpack are often already soaked.

Gliding avalanches, including large ones, are still possible. Although these will become more frequent as the day progresses, some may also be released during the night or in the early morning.

Weather review for Thursday, 11.04.2024

It was sunny and mild.

New snow

-

Temperature

At midday at 2000 m, around +7 °C.

Wind

Winds were mostly light.

Weather forecast until Friday, 12.04.2024

After a mostly clear night, it will be sunny and mild.

New snow

-

Temperature

At midday at 2000 m, around +10 °C.

Wind

Winds will be light.

Trend until Sunday, 14.04.2024

After mostly clear nights with high levels of outgoing radiation, it will be sunny and mild during the day. The zero-degree level will be around 3800 m. Winds will be light, becoming increasingly moderate at high altitudes on Sunday, from the west. The danger of dry avalanches will continue to decrease. After the clear nights, rather favourable conditions are to be expected in the early mornings. Each day, the danger of wet avalanches will increase appreciably as the day progresses. Gliding avalanches are expected, including large ones. Although these will become more frequent as the day progresses, some may also be released during the night or in the early morning. Ski tours and hut ascents should be started and finished early.
