

## Danger Level 1 - Low

**Tendency: Constant avalanche danger** →  
on Friday 21 03 2025

The new snow of the last two days is lying on the quite favourable surface of an old snowpack above approximately 1800 m.

Adjacent to ridgelines and in gullies and bowls and above approximately 1900 m gliding avalanches and snow slides are possible, but they will be mostly small. The avalanche prone locations are to be found also at the base of rock walls and on steep slopes.

### Snowpack

Slow warming. The old snowpack will be generally stable.
