

Avalanche danger

updated on 24.3.2024, 17:00

region A Considerable (3-)

Wind slab

Avalanche prone locations

Danger description

The new snow and wind slabs of the weekend are prone to triggering. The avalanche prone locations are sometimes covered with new snow and are therefore difficult to recognise. Avalanches can be released, even by a single winter sport participant and reach medium size. As a consequence of a strengthening foehn wind, further wind slabs will form in the afternoon. Backcountry touring calls for experience in the assessment of avalanche danger and careful route selection.

Moderate (2)

Wet snow, Gliding snow

As a consequence of warming during the day and solar radiation a large number of loose snow slides are to be expected, even medium-sized ones. In addition further occasionally large gliding avalanches are possible. This applies in particular on steep grassy slopes below approximately 2600 m. Areas with glide cracks are to be avoided.

region B

Moderate (2+)

Wind slab

Avalanche prone locations

Danger description

The fresh wind slabs are in some cases prone to triggering. Additionally in some places avalanches can also be released in near-surface layers of the snowpack. Avalanches can reach medium size. The number and size of avalanche prone locations will increase with altitude. Backcountry touring and other off-piste activities call for careful route selection.

Moderate (2)

Gliding snow

Avalanche prone locations

Danger description

In particular on steep grassy slopes occasionally large gliding avalanches are possible. Areas with glide cracks are to be avoided.

region C

Moderate (2+)

Wind slab

Avalanche prone locations

Danger description

The fresh wind slabs are in some cases prone to triggering. Additionally in some places avalanches can also be released in near-surface layers of the snowpack. Avalanches can reach medium size. The number and size of avalanche prone locations will increase with altitude. Backcountry touring and other off-piste activities call for careful route selection.

Moderate (2)

Wet snow, Gliding snow

As a consequence of warming during the day and solar radiation a large number of loose snow slides are to be expected, even medium-sized ones. In addition further occasionally large gliding avalanches are possible. This applies in particular on steep grassy slopes below approximately 2600 m. Areas with glide cracks are to be avoided.

region D

Moderate (2=)

Wind slab

Avalanche prone locations

Danger description

The fresh wind slabs are in some cases prone to triggering. The avalanche prone locations are to be found in particular adjacent to ridgelines and in gullies and bowls. Avalanches are rather small. The fresh wind slabs are to be evaluated with care and prudence in very steep terrain.

Low (1)

Gliding snow

Gliding avalanches are possible, especially on steep grassy slopes. These can in some cases reach medium size. Areas with glide cracks are to be avoided as far as possible.

region E

Moderate (2=)

Wind slab

Avalanche prone locations

Danger description

The fresh wind slabs are in some cases prone to triggering. The avalanche prone locations are to be found in particular adjacent to ridgelines and in gullies and bowls. Avalanches are rather small. The fresh wind slabs are to be evaluated with care and prudence in very steep terrain.

Moderate (2)

Wet snow, Gliding snow

As a consequence of warming during the day and solar radiation a large number of loose snow slides are to be expected, even medium-sized ones. In addition further occasionally large gliding avalanches are possible. This applies in particular on steep grassy slopes below approximately 2600 m. Areas with glide cracks are to be avoided.

region F

Moderate (2-)

Wind slab

Avalanche prone locations

Danger description

The wind slabs of the weekend are in some cases prone to triggering. Additionally in isolated cases avalanches can also be released in near-surface layers of the snowpack and reach medium size. Careful route selection is recommended.

Moderate (2)

Gliding snow

Avalanche prone locations

Danger description

In particular on steep grassy slopes occasionally large gliding avalanches are possible. Areas with glide cracks are to be avoided.

region G

Moderate (2)

Gliding snow

Avalanche prone locations

Danger description

In particular on steep grassy slopes occasionally large gliding avalanches are possible. Areas with glide cracks are to be avoided.

Low (1)

No distinct avalanche problem

Individual avalanche prone locations for dry avalanches are to be found in particular in extremely steep terrain. Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls.

region H

Low (1)

Gliding snow
Gliding avalanches are possible, especially on steep grassy slopes. These can in some cases reach medium size. Areas with glide cracks are to be avoided as far as possible.

Snowpack and weather
