Wind slab

Snowpack stability: **poor**

Frequency: **few**

Avalanche size: **medium**

Wet snow

Snowpack stability: **poor**

Frequency: **few**

Avalanche size: **small**

The snow sport conditions outside marked and open pistes are quite favourable.

The older wind slabs are in individual cases still prone to triggering. They can still be released in some cases, especially on very steep shady slopes in little used backcountry terrain. This applies especially above approximately 2600 m along the border with France and along the border between Valais and Italy. A clear night: Outgoing longwave radiation during the night will be good. The surface of the snowpack will freeze to form a strong crust and will soften during the day. As a consequence of warming during the day and solar radiation mostly small loose snow avalanches are possible.

Snowpack

The wind was light. This week's fresh and windy snow are gradually settling and stabilising. Sunny slopes: The surface of the snowpack has frozen to form a strong crust and will soften during the day. In shady places that are protected from the wind: Towards its surface, the snowpack is dry and has a loosely bonded surface. Snow depths vary greatly above approximately 2200 m, depending on the influence of the wind. Adjacent to ridgelines and in pass areas and at high altitude a little snow is lying. At low altitude less snow than usual is lying.

Tendency

The snow sport conditions outside marked and open pistes are quite favourable.

Danger Level 1 - Low

AM:

Tendency: Constant avalanche danger →
on Wednesday 05 03 2025

Wind slab

2500m

Snowpack stability: **fair**

Frequency: **few**

The snow sport conditions outside marked and open pistes are quite favourable.

The older wind slabs are in individual cases still prone to triggering. They can still be released in some cases, especially on very steep shady slopes in little used backcountry terrain.

A clear night: Outgoing longwave radiation during the night will be good. The surface of the snowpack will freeze to form a strong crust and will soften during the day. As a consequence of warming during the day and solar radiation mostly small loose snow avalanches are possible. Restraint should be exercised because avalanches can sweep people along and give rise to falls.

Snowpack

The wind was light.

Sunny slopes: The surface of the snowpack has frozen to form a strong crust and will soften during the day. In shady places that are protected from the wind: Towards its surface, the snowpack is dry and has a loosely bonded surface.

Snow depths vary greatly above approximately 2200 m, depending on the influence of the wind. Adjacent to ridgelines and in pass areas and at high altitude a little snow is lying. At low altitude less snow than usual is lying. Below approximately 2200 m no snow is lying on south facing slopes.

Tendency

The snow sport conditions outside marked and open pistes are quite favourable.

Danger Level 1 - Low

Tendency: Constant avalanche danger
on Wednesday 05 03 2025

In all aspects only a small amount of snow is lying for the time of year.

Very isolated avalanche prone locations are to be found on extremely steep northwest, north and northeast facing slopes in high Alpine regions. Avalanches can be released in the old snowpack by large loads.

There is a danger of falling on the hard snow surface, in particular on very steep sunny slopes.

Snowpack

The wind was light.

Sunny slopes: The surface of the snowpack has frozen to form a strong crust and will soften during the day.

In shady places that are protected from the wind: Towards its surface, the snowpack is dry and has a loosely bonded surface.

In all aspects only a small amount of snow is lying for the time of year. On sunny slopes below approximately 2600 m hardly any snow is lying.

Tendency

The avalanche danger will persist.
