

Avalanche danger
updated on 19.11.2024, 17:00

region A

High (4-)

New snow

Avalanche prone locations

Danger description

As a consequence of new snow and a strong to storm force westerly wind, extensive wind slabs will form during the night. Large quantities of fresh snow and the wind-drifted snow represent the main danger. The danger exists in particular in alpine snow sports terrain. Numerous medium-sized and large natural avalanches are to be expected, this applies in particular during the night. Caution is to be exercised on steep north and east facing slopes in high Alpine regions. The backcountry touring conditions are critical.

region B

Considerable (3+)

New snow

Avalanche prone locations

Danger description

As a consequence of new snow and a strong to storm force westerly wind, sometimes large wind slabs will form during the night. The new snow and wind slabs represent the main danger. Persons can release avalanches. Natural avalanches are possible in particular during the night. Avalanches can in isolated cases reach large size. This applies in particular on steep north and east facing slopes in high Alpine regions. Backcountry touring and other off-piste activities call for extensive experience and restraint.

region C

Considerable (3-)

New snow

Avalanche prone locations

Danger description

As a consequence of new snow and a strong to storm force northwesterly wind, sometimes large wind slabs will form. New snow and wind slabs can in some places be released, even by a single winter sport participant, in particular at elevated altitudes. In many cases avalanches are medium-sized. Snow sport activities outside marked and open pistes call for experience in the assessment of avalanche danger.

region D

Moderate (2=)

Wind slab

Avalanche prone locations

Danger description

As a consequence of new snow and a moderate to strong northwesterly wind, rather small wind slabs will form in particular in gullies and bowls. These are to be evaluated with care and prudence in particular in terrain where there is a danger of falling. The avalanches are small but in some cases easily released. The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

region E

Moderate (2=)

New snow

Avalanche prone locations

Danger description

New snow and wind slabs can in some places be released by people. Avalanches can reach medium size. The current avalanche situation calls for careful route selection.

region F

Low (1)

Wind slab

Only a little snow is lying. As a consequence of new snow and wind, small wind slabs will form in particular in the vicinity of peaks. They are to be evaluated with care and prudence in particular in terrain where there is a danger of falling.
