

Danger Level 1 - Low

Tendency: Constant avalanche danger →
on Tuesday 06 05 2025

Wet snow

Snowpack stability: **very poor**

Frequency: **few**

Avalanche size: **small**

Moist and wet avalanches are the main danger.

Above approximately 2000 m mostly small natural wet avalanches are possible. The avalanche prone locations are to be found especially in gullies and bowls and on very steep slopes. The next avalanche bulletin will appear on 1 December, or sooner in the event of an unexpected change in the avalanche situation.

Snowpack

Danger patterns

dp.10: springtime scenario

At low and intermediate altitudes no snow is lying. At elevated altitudes the snowpack is subject to significant local variations. The older wind slabs are to be found especially in gullies and bowls and in the high Alpine regions. The weather conditions gave rise to extreme and thorough wetting of the snowpack.
