

Avalanche danger
updated on 16.4.2024, 17:00

region A

Considerable (3=)

New snow

Avalanche prone locations

Danger description

As a consequence of new snow and a sometimes strong northwesterly wind, avalanche prone wind slabs will form. The new snow and wind slabs can be released by a single winter sport participant. In addition as the day progresses individual natural avalanches are possible. Avalanches can in isolated cases reach large size. Backcountry touring and other off-piste activities call for experience in the assessment of avalanche danger.

region B

Considerable (3-)

Wind slab

Avalanche prone locations

Danger description

As a consequence of new snow and a sometimes strong northwesterly wind, avalanche prone wind slabs will form. The avalanche prone locations are to be found in particular in gullies and bowls, and behind abrupt changes in the terrain and in places that are protected from the wind. Single winter sport participants can release avalanches, including medium-sized ones. Backcountry touring and other off-piste activities call for experience in the assessment of avalanche danger.

region C

Moderate (2=)

Wind slab

Avalanche prone locations

Danger description

As a consequence of new snow and a sometimes strong northwesterly wind, sometimes avalanche prone wind slabs will form. Avalanches can in some places be released, even by a single winter sport participant. They can in isolated cases reach medium size. The avalanche prone locations are to be found in particular adjacent to ridgelines and in gullies and bowls, and behind abrupt changes in the terrain. The wind slabs are to be evaluated with care and prudence in steep terrain.

region D

Moderate (2=)

Wind slab

Avalanche prone locations

Danger description

As a consequence of new snow and strong wind the previously small wind slabs will increase in size. Avalanches can in some places be released, even by a single winter sport participant. They can in isolated cases reach medium size. The avalanche prone locations are to be found in particular adjacent to ridgelines and in gullies and bowls, and behind abrupt changes in the terrain. In high Alpine regions the avalanche prone locations are a little more prevalent. The wind slabs are to be evaluated with care and prudence in steep terrain.

region E

Low (1)

No distinct avalanche problem

Individual avalanche prone locations are to be found in particular in extremely steep terrain. Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls.

Snowpack and weather
