

Avalanche danger

updated on 7.6.2025, 17:00

region A

Moderate (2=)

Wind slab

Avalanche prone locations

Danger description

Fresh and older wind slabs are to be found in particular adjacent to ridgelines and in gullies and bowls. They can in some places be released by a single winter sport participant, but they will be small in most cases. The wind slabs are to be evaluated with care and prudence in particular in very steep terrain. Apart from the danger of being buried, restraint should be exercised as well in view of the danger of avalanches sweeping people along and giving rise to falls.

The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

Moderate (2)

Wet snow

The snowpack will be wet all the way through at high altitude. In particular on very steep north facing slopes individual wet avalanches are possible.

In high Alpine regions moist snow slides are to be expected as the day progresses.

Backcountry tours should be concluded timely.

region B

Moderate (2=)

Wind slab

Avalanche prone locations

Danger description

Fresh and older wind slabs are to be found in particular adjacent to ridgelines and in gullies and bowls. They can in some places be released by a single winter sport participant, but they will be small in most cases. The wind slabs are to be evaluated with care and prudence in particular in very steep terrain. Apart from the danger of being buried, restraint should be exercised as well in view of the danger of avalanches sweeping people along and giving rise to falls.

The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

Low (1)

Wet snow

The snowpack will be wet all the way through at high altitude. On very steep slopes wet avalanches are possible as the day progresses.

region C

Low (1)

Wet snow

The snowpack will be wet all the way through at high altitude. On very steep slopes wet avalanches are possible as the day progresses.

The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

**Avalanche bulletin through Sunday, 8. June 2025****Snowpack and weather**

updated on 7.6.2025, 17:00

**Snowpack**

Below approximately 3000 m, the snowpack is saturated. In the high alpine regions, snow fell on repeated occasions at the end of the week, most of it in the Bernina region, where around 1 m accumulated. The fresh snow was transported by the sometimes strong southwesterly wind.

**Weather review for Saturday**

It was mostly cloudy with precipitation. The snowfall level was between 2800 m in the northwest and 3200 m in the southeast.

**Fresh snow**

From Friday to Saturday afternoon, the following amounts fell in the high alpine regions:

- Northern Alpine Ridge from the Trient to the Bernese Oberland: 10 to 20 cm
- Less elsewhere

Due to the showery precipitation, the exact amounts vary from place to place.

**Temperature**

At midday at 2000 m, + 9 °C

**Wind**

There was a moderate to strong southwesterly wind.

**Weather forecast until Whit Sunday**

The precipitation from the west will end during the night. During the day it will remain mostly cloudy on the central and eastern parts of the northern flank of the Alps and in northern Grisons below 3200 m, while elsewhere it will become increasingly sunny.

**Fresh snow**

The snowfall level will be around 3200 m. The following amounts are expected to fall in the high alpine regions up until Sunday morning:

- Grisons: 5 to 10 cm
- Less elsewhere

**Temperature**

At midday at 2000 m, between +6 °C in the north and +11 °C in the south

**Wind**

There will be a strong to stormy westerly wind in the high alpine regions

**Outlook until Tuesday**

Following mostly clear nights, it will be mostly sunny during the day, with cumulus clouds appearing in the afternoon. The zero-degree level will rise to 4000 m and there will be a light to moderate westerly wind in the high alpine regions. The danger of dry avalanches will decrease and will be increasingly limited to extremely steep northern slopes in the high alpine regions. This means that generally favourable conditions will prevail in the early morning. Wet avalanches during the day are possible. Ski touring should be started early and finished in good time.
