

Avalanche danger
updated on 1.4.2024, 17:00

Danger levels

1 low

2 moderate

3 considerable

4 high

5 very high

region A

High (4-)

New snow

Avalanche prone locations

Danger description

Large quantities of fresh snow and the wind-drifted snow are prone to triggering. At intermediate altitudes dry avalanches can release the wet old snow as well. Natural avalanches are still possible especially during the course of the night. Exposed transportation routes can be endangered.
From early morning probably danger level 3 (considerable) will be reached. Single winter sport participants can release avalanches in some places, including very large ones. Backcountry touring and other off-piste activities call for great caution and restraint.

Considerable (3)

Wet snow, Gliding snow

Avalanche prone locations

Danger description

The snowpack will be wet all the way through at intermediate altitudes. Gliding avalanches can be released at any time of day or night. Caution is to be exercised in areas with glide cracks. As a consequence of solar radiation more frequent moist avalanches are to be expected. The avalanches can reach large size.

region B

Considerable (3+)

New snow

Avalanche prone locations

Danger description

The fresh snow and the extensive wind slabs are in some cases still prone to triggering. Single snow sport participants can release avalanches in some places. Natural avalanches are possible in isolated cases as before. Avalanches can reach large size. Backcountry touring and other off-piste activities call for experience in the assessment of avalanche danger and restraint.

Considerable (3)

Wet snow, Gliding snow

Avalanche prone locations

Danger description

The snowpack will be wet all the way through at intermediate altitudes. Gliding avalanches can be released at any time of day or night. Caution is to be exercised in areas with glide cracks. As a consequence of solar radiation more frequent moist avalanches are to be expected. The avalanches can reach large size.

region C

Considerable (3+)

New snow

Avalanche prone locations

Danger description

The fresh snow and the extensive wind slabs are in some cases still prone to triggering. Single snow sport participants can release avalanches in some places. Natural avalanches are possible in isolated cases as before. Avalanches can reach large size. Backcountry touring and other off-piste activities call for experience in the assessment of avalanche danger and restraint.

Moderate (2)

Gliding snow

Avalanche prone locations

Danger description

In particular on steep grassy slopes individual occasionally large gliding avalanches are possible. Areas with glide cracks are to be avoided. In addition wet snow slides and avalanches are possible.

region D

Considerable (3=)

New snow, Wind slab

Avalanche prone locations

Danger description

As a consequence of new snow and westerly wind, further wind slabs will form on Tuesday especially in the west. The fresh and somewhat older wind slabs are prone to triggering. Even single snow sport participants can release avalanches. These can reach medium size. Backcountry touring and other off-piste activities call for experience in the assessment of avalanche danger and caution.

Moderate (2)

Gliding snow

Avalanche prone locations

Danger description

In particular on steep grassy slopes individual occasionally large gliding avalanches are possible. Areas with glide cracks are to be avoided. In addition wet snow slides and avalanches are possible.

region E

Considerable (3-)

New snow, Wind slab

Avalanche prone locations

Danger description

The wind slabs of the last few days are in some cases still prone to triggering. They will be covered with new snow in some cases and therefore difficult to recognise. As a consequence of new snow and westerly wind, mostly small wind slabs will form on Tuesday. These are to be avoided in steep terrain. Single winter sport participants can release avalanches in some places. Mostly the avalanches are medium-sized. Backcountry touring and other off-piste activities call for experience in the assessment of avalanche danger.

Moderate (2)

Gliding snow

Avalanche prone locations

Danger description

In particular on steep grassy slopes individual occasionally large gliding avalanches are possible. Areas with glide cracks are to be avoided. In addition wet snow slides and avalanches are possible.

region F

Considerable (3)

Wet snow, Gliding snow

Avalanche prone locations

Danger description

The snowpack will be wet all the way through at intermediate altitudes. Gliding avalanches can be released at any time of day or night. Caution is to be exercised in areas with glide cracks. As a consequence of solar radiation more frequent moist avalanches are to be expected. The avalanches can reach large size.

region G

Moderate (2=)

Wind slab

Avalanche prone locations

Danger description

The fresh and somewhat older wind slabs are in some cases prone to triggering. The avalanche prone locations are to be found in particular in gullies and bowls, and behind abrupt changes in the terrain,, also at a distance from ridgelines. Avalanches can reach medium size.
Backcountry touring calls for careful route selection.

Low (1)

Gliding snow

In particular on steep grassy slopes individual gliding avalanches are possible. These can in some cases reach medium size. Areas with glide cracks are to be avoided as far as possible.
In addition individual moist snow slides are possible.

region H

Moderate (2=)

Wind slab

Avalanche prone locations

Danger description

The fresh and somewhat older wind slabs are in some cases prone to triggering. The avalanche prone locations are to be found in particular in gullies and bowls, and behind abrupt changes in the terrain,, also at a distance from ridgelines. Avalanches can reach medium size.
Backcountry touring calls for careful route selection.

Moderate (2)

Gliding snow

Avalanche prone locations

Danger description

In particular on steep grassy slopes individual occasionally large gliding avalanches are possible. Areas with glide cracks are to be avoided.
In addition wet snow slides and avalanches are possible.

region I

Low (1)

**Wind slab**

As a consequence of new snow and westerly wind, wind slabs will form at elevated altitudes. They are small but in some cases prone to triggering.

Restraint should be exercised because avalanches can sweep people along and give rise to falls.

Low (1)

Gliding snow

In particular on steep grassy slopes individual gliding avalanches are possible. These can in some cases reach medium size. Areas with glide cracks are to be avoided as far as possible.

In addition individual moist snow slides are possible.
