

Danger Level 2 - Moderate

Tendency: Constant avalanche danger →
on Friday 11 04 2025

Wind slab

Snowpack stability: **fair**

Frequency: **some**

Avalanche size: **medium**

Wet snow

Snowpack stability: **poor**

Frequency: **few**

Avalanche size: **small**

As a consequence of solar radiation the avalanche prone locations will become more prevalent as the day progresses.

The avalanche prone locations are to be found in particular at the base of rock walls and behind abrupt changes in the terrain and adjacent to ridgelines and in gullies and bowls. In addition the wind slabs must be taken into account.

The avalanches can be released by large loads.

In many places there is a danger of falling on the hard snow surface.

Snowpack

The solar radiation will give rise as the day progresses to increasing moistening of the snowpack on sunny slopes. On south facing slopes a little snow is lying at low and intermediate altitudes.

Tendency

Significant warming. The danger of moist and wet avalanches will increase during the day.
