

## Danger Level 1 - Low

**Tendency: Increasing avalanche danger**  
on Sunday 09 03 2025

The snow sport conditions outside marked and open pistes are quite favourable.

Avalanches can in very isolated cases be released in the old snowpack, especially on very steep shady slopes in little used backcountry terrain. Restraint should be exercised because avalanches can sweep people along and give rise to falls.

A clear night: Outgoing longwave radiation during the night will be good. The surface of the snowpack will freeze to form a strong crust and will soften later than the day before.

### Snowpack

The wind was light.

Sunny slopes: The surface of the snowpack has frozen to form a strong crust and will soften during the day. In shady places that are protected from the wind: Towards its surface, the snowpack is dry and has a loosely bonded surface.

Snow depths vary greatly above approximately 2200 m, depending on the influence of the wind. Adjacent to ridgelines and in pass areas and at high altitude a little snow is lying. At low altitude less snow than usual is lying. Below approximately 2200 m no snow is lying on south facing slopes.

### Tendency

Some new snow above approximately 1200 m: In the evening as a consequence of new snow and strong wind there will be an increase in the avalanche danger.

## Danger Level 1 - Low

**Tendency: Increasing avalanche danger**  
on Sunday 09 03 2025

In all aspects only a small amount of snow is lying for the time of year.

Very isolated avalanche prone locations are to be found on extremely steep northwest, north and northeast facing slopes in high Alpine regions. Avalanches can be released in the old snowpack by large loads.

There is a danger of falling on the hard snow surface, in particular on very steep sunny slopes.

### Snowpack

The wind was light.

Sunny slopes: The surface of the snowpack has frozen to form a strong crust and will soften during the day.

In shady places that are protected from the wind: Towards its surface, the snowpack is dry and has a loosely bonded surface.

In all aspects only a small amount of snow is lying for the time of year. On sunny slopes below approximately 2600 m hardly any snow is lying.

### Tendency

New snow above approximately 1200 m: In the evening as a consequence of new snow and strong wind there will be an increase in the avalanche danger.

## Danger Level 1 - Low

**Tendency: Constant avalanche danger** →  
on Sunday 09 03 2025

The snow sport conditions outside marked and open pistes are quite favourable.

Avalanches can in very isolated cases be released in the old snowpack, especially on very steep shady slopes in little used backcountry terrain. This applies especially above approximately 2700 m along the border with France and along the border between Valais and Italy.

A clear night: Outgoing longwave radiation during the night will be good. The surface of the snowpack will freeze to form a strong crust and will soften later than the day before. Restraint should be exercised because avalanches can sweep people along and give rise to falls.

### Snowpack

The wind was light.

Sunny slopes: The surface of the snowpack has frozen to form a strong crust and will soften during the day. In shady places that are protected from the wind: Towards its surface, the snowpack is dry and has a loosely bonded surface.

Snow depths vary greatly above approximately 2200 m, depending on the influence of the wind. Adjacent to ridgelines and in pass areas and at high altitude a little snow is lying. At low altitude less snow than usual is lying.

### Tendency

A little new snow above approximately 1200 m: In the evening as a consequence of new snow and strong wind there will be only a slight increase in the avalanche danger.
