

Danger Level 1 - Low

Tendency: Constant avalanche danger →
on Sunday 23 03 2025

Wet snow

1700m

Snowpack stability: **very poor**

Frequency: **few**

Avalanche size: **small**

Wet snow slides and avalanches are the main danger.

Adjacent to ridgelines and in gullies and bowls and above approximately 1900 m wet snow slides and avalanches are possible, but they will be mostly small. Individual medium-sized avalanches are not entirely ruled out.

Snowpack

Rain to the high Alpine regions. The old snowpack will become gradually moist. The old wind slabs are to be found especially in gullies and bowls and generally in the high Alpine regions.
