

Avalanche danger

updated on 1.1.2025, 17:00

region A

Moderate (2+)

Persistent weak layers

Avalanche prone locations

Danger description

A treacherous avalanche situation will prevail. Distinct weak layers exist deep in the snowpack. Avalanches can be released by a single winter sport participant and reach large size. The avalanche prone locations are rare but are barely recognisable, even to the trained eye. Caution is to be exercised in particular in areas where the snow cover is rather shallow. As a consequence of a strengthening westerly wind, mostly small wind slabs will form at elevated altitudes. Ski touring calls for defensive route selection. Maintaining distances between individuals and one-at-a-time descents are recommended.

region B

Moderate (2+)

Persistent weak layers

Avalanche prone locations

Danger description

A treacherous avalanche situation will prevail. Distinct weak layers exist deep in the snowpack. Avalanches can be released by a single winter sport participant and reach medium size. The avalanche prone locations are rather rare but are barely recognisable, even to the trained eye. Whumpfung sounds can indicate the danger. Caution is to be exercised in particular in areas where the snow cover is rather shallow, as well as at transitions from a shallow to a deep snowpack. Ski touring calls for defensive route selection. Maintaining distances between individuals and one-at-a-time descents are recommended.

region C

Moderate (2+)

Persistent weak layers

Avalanche prone locations

Danger description

A treacherous avalanche situation will prevail. Distinct weak layers exist deep in the snowpack. Avalanches can be released by a single winter sport participant and reach large size. The avalanche prone locations are rare but are barely recognisable, even to the trained eye. Caution is to be exercised in particular in areas where the snow cover is rather shallow. As a consequence of a strengthening westerly wind, mostly small wind slabs will form at elevated altitudes. Ski touring calls for defensive route selection. Maintaining distances between individuals and one-at-a-time descents are recommended.

Moderate (2)

Gliding snow

Avalanche prone locations

Danger description

Medium-sized and, in isolated cases, large gliding avalanches are possible, in isolated cases also on very steep shady slopes. Areas with glide cracks are to be avoided as far as possible.

region D

Moderate (2+)

Persistent weak layers

Avalanche prone locations

Danger description

A treacherous avalanche situation will prevail. Distinct weak layers exist deep in the snowpack. Avalanches can be released by a single winter sport participant and reach medium size. The avalanche prone locations are rather rare but are barely recognisable, even to the trained eye. Whumpfung sounds can indicate the danger. Caution is to be exercised in particular in areas where the snow cover is rather shallow, as well as at transitions from a shallow to a deep snowpack. Ski touring calls for defensive route selection. Maintaining distances between individuals and one-at-a-time descents are recommended.

Moderate (2)

Gliding snow

Avalanche prone locations

Danger description

Medium-sized and, in isolated cases, large gliding avalanches are possible,, in isolated cases also on very steep shady slopes. Areas with glide cracks are to be avoided as far as possible.

region E

Moderate (2=)

Wind slab

Avalanche prone locations

Danger description

The westerly wind will transport the loosely bonded old snow. The fresh wind slabs will be deposited on the unfavourable surface of an old snowpack on shady slopes. In the course of the day the wind slabs will increase in size additionally. Avalanches can in some places be released by a single winter sport participant and reach medium size. These avalanche prone locations are to be found in particular in gullies and bowls, and behind abrupt changes in the terrain. Avalanches can additionally in very isolated cases be released in deep layers above approximately 2400 m. Careful route selection is important.

Moderate (2)

Gliding snow

Avalanche prone locations

Danger description

Medium-sized and, in isolated cases, large gliding avalanches are possible,, in isolated cases also on very steep shady slopes. Areas with glide cracks are to be avoided as far as possible.

region F

Moderate (2=)

Persistent weak layers

Avalanche prone locations

Danger description

Distinct weak layers exist in the snowpack. The avalanche prone locations are to be found in particular in gullies and bowls, and behind abrupt changes in the terrain,, also at a distance from ridgelines. Avalanches can reach medium size. Isolated whumpfung sounds can indicate the danger. As a consequence of a strengthening westerly wind, mostly small wind slabs will form at elevated altitudes. Backcountry touring calls for careful route selection.

region G

Moderate (2=)

Wind slab

Avalanche prone locations

Danger description

The westerly wind will transport the loosely bonded old snow. The fresh wind slabs will be deposited on the unfavourable surface of an old snowpack on shady slopes. In the course of the day the wind slabs will increase in size additionally. Avalanches can in some places be released by a single winter sport participant and reach medium size. These avalanche prone locations are to be found in particular in gullies and bowls, and behind abrupt changes in the terrain. Avalanches can additionally in very isolated cases be released in deep layers above approximately 2400 m. Careful route selection is important.

Moderate (2)

Gliding snow

Avalanche prone locations

Danger description

Medium-sized and, in isolated cases, large gliding avalanches are possible,, in isolated cases also on very steep shady slopes. Areas with glide cracks are to be avoided as far as possible.

region H

Moderate (2-)

Persistent weak layers

Avalanche prone locations

Danger description

Only a little snow is lying. Old wind slabs are lying on top of a weakly bonded old snowpack. They can still be released in some cases. The avalanche prone locations are to be found in particular in gullies and bowls, and behind abrupt changes in the terrain. Mostly the avalanches are small. Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls.

region I

Low (1)

Wind slab
Individual avalanche prone locations for dry avalanches are to be found in particular in extremely steep terrain. As a consequence of a strong to storm force westerly wind, mostly small wind slabs will form, in particular on shady slopes at elevated altitudes. The fresh wind slabs are clearly recognisable to the trained eye. They are to be avoided in terrain where there is a danger of falling.

region J

Low (1)

Wind slab
Individual avalanche prone locations for dry avalanches are to be found in particular in extremely steep terrain. As a consequence of a strong to storm force westerly wind, mostly small wind slabs will form, in particular on shady slopes at elevated altitudes. The fresh wind slabs are clearly recognisable to the trained eye. They are to be avoided in terrain where there is a danger of falling.

Low (1)

Gliding snow
On very steep grassy slopes small and, in isolated cases, medium-sized gliding avalanches are possible. Caution is to be exercised in areas with glide cracks.
