

Avalanche danger
updated on 4.2.2024, 17:00

region A Moderate (2-)

Wind slab

Avalanche prone locations

Danger description

As a consequence of a moderate to strong northwesterly wind, wind slabs formed at elevated altitudes. These are rather small but in some cases prone to triggering. They are to be evaluated with care and prudence in steep terrain.

Low (1)

Gliding snow

On steep grassy slopes more gliding avalanches are possible, even large ones in isolated cases. Caution is to be exercised in areas with glide cracks.

region B

Moderate (2-)

Wind slab

Avalanche prone locations

Danger description

As a consequence of a sometimes strong wind from westerly directions, wind slabs formed in particular adjacent to ridgelines and in gullies and bowls. These are rather small but in some cases prone to triggering. They are to be evaluated with care and prudence in steep terrain. Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls.

Low (1)

Gliding snow

On steep grassy slopes more gliding avalanches are possible, even large ones in isolated cases. Caution is to be exercised in areas with glide cracks.

region C

Moderate (2-)

Wind slab

Avalanche prone locations

Danger description

As a consequence of a moderate to strong northwesterly wind, wind slabs formed at elevated altitudes. These are rather small but in some cases prone to triggering. They are to be evaluated with care and prudence in steep terrain.

region D

Moderate (2-)

Wind slab

Avalanche prone locations

Danger description

As a consequence of a sometimes strong wind from westerly directions, wind slabs formed in particular adjacent to ridgelines and in gullies and bowls. These are rather small but in some cases prone to triggering. They are to be evaluated with care and prudence in steep terrain. Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls.

Moderate (2)

Gliding snow

Avalanche prone locations

Danger description

Medium-sized and, in isolated cases, large gliding avalanches are possible. Areas with glide cracks are to be avoided as far as possible.

region E

Moderate (2-)

Wind slab

Avalanche prone locations

Danger description

As a consequence of a moderate to strong northwesterly wind, wind slabs formed at elevated altitudes. These are rather small but in some cases prone to triggering. They are to be evaluated with care and prudence in steep terrain.

Moderate (2)

Gliding snow

Avalanche prone locations

Danger description

Medium-sized and, in isolated cases, large gliding avalanches are possible. Areas with glide cracks are to be avoided as far as possible.

region F

Moderate (2)

Gliding snow

Avalanche prone locations

Danger description

Medium-sized and, in isolated cases, large gliding avalanches are possible. Areas with glide cracks are to be avoided as far as possible.

Low (1)

Wind slab

Individual avalanche prone locations for dry avalanches are to be found in particular in extremely steep terrain. As a consequence of a moderate to strong northwesterly wind, mostly small wind slabs formed. These are to be evaluated with care and prudence in very steep terrain. The number and size of avalanche prone locations will increase in the high Alpine regions. Restraint should be exercised because avalanches can sweep people along and give rise to falls.

region G

Low (1)

Wind slab

Individual avalanche prone locations for dry avalanches are to be found in particular in extremely steep terrain. As a consequence of a moderate to strong northwesterly wind, mostly small wind slabs formed. These are to be evaluated with care and prudence in very steep terrain. The number and size of avalanche prone locations will increase in the high Alpine regions. Restraint should be exercised because avalanches can sweep people along and give rise to falls.

region H

Low (1)

Wind slab

Individual avalanche prone locations for dry avalanches are to be found in particular in extremely steep terrain. As a consequence of a moderate to strong northwesterly wind, mostly small wind slabs formed. These are to be evaluated with care and prudence in very steep terrain. The number and size of avalanche prone locations will increase in the high Alpine regions. Restraint should be exercised because avalanches can sweep people along and give rise to falls.

Low (1)

Gliding snow

On steep grassy slopes more gliding avalanches are possible, even large ones in isolated cases. Caution is to be exercised in areas with glide cracks.

Avalanche bulletin through Monday, 5. February 2024**Snowpack and weather**

updated on 4.2.2024, 17:00

Snowpack

With strong northwesterly winds at times, mostly small snowdrift accumulations have formed. On south-facing slopes, the surface of the snowpack became moist up to around 2500 m, where a crust froze during the night. Otherwise, the surface of the snowpack is characterised by the wind in many places and is usually hard or brittle. There are still isolated weak layers in the old snowpack near the surface above approximately 2500 m, but hardly any avalanches have been reported over the past few days. The bottom section of the snowpack is generally stable.

Individual gliding avalanches are still possible. This is mainly the case on east-, south- and west-facing slopes below approximately 2600 m and more rarely on north-facing slopes below around 2200 m. These avalanches may be large in regions with a lot of snow.

Weather review for Sunday, 04.02.2024

It was sunny and mild.

New snow

-

Temperature

At midday at 2000 m, between +6 °C in the west and south and +3 °C in the east.

Wind

There was a moderate wind. There were strong northwesterly winds on the Main Alpine Ridge and partly also in the high Alpine regions.

Weather forecast until Monday, 05.02.2024

After a clear night, it will be sunny and mild during the day.

New snow

-

Temperature

At midday at 2000 m, between +6 °C in the west and south and +3 °C in the east.

Wind

- There will still be a strong northwesterly wind during the night, especially in the east.
- Otherwise, there will be a light to moderate westerly wind.

Trend until Wednesday, 07.02.2024

Monday night into Tuesday will be clear, and it will be sunny during the day on Tuesday. Tuesday night into Wednesday will be partly clear. On Wednesday morning, it will be quite sunny at first, with clouds gathering from the west as the day progresses. There will be a light to moderate westerly wind.

The danger of dry avalanches will continue to decrease. Individual gliding avalanches are still possible.
